

SBAS487D - NOVEMBER 2009-REVISED JANUARY 2011

# 11-Bit, 200MSPS/9-Bit, 250MSPS, Ultralow-Power ADCs with Analog Buffer

Check for Samples: ADS58B18, ADS58B19

# **FEATURES**

- ADS58B18: 11-Bit. 200MSPS
- ADS58B19: 9-Bit, 250MSPS
- **Integrated High-Impedance Analog Input Buffer**
- **Ultralow Power:** 
  - Analog Power: 258mW at 200MSPS
  - I/O Power: 69mW (DDR LVDS, low LVDS swing)
- **High Dynamic Performance:** 
  - ADS58B18: 66dBFS SNR and 81dBc SFDR at 150MHz
  - ADS58B19: 55.7dBFS SNR and 76dBc SFDR at 150MHz
- **Enhanced SNR Using TI-Proprietary SNRBoost** Technology (ADS58B18 Only)
  - -77.7dBFS SNR in 20MHz Bandwidth
- **Dynamic Power Scaling with Sample Rate**
- **Output Interface:** 
  - Double Data Rate (DDR) LVDS with **Programmable Swing and Strength** 
    - Standard Swing: 350mV
    - Low Swing: 200mV
    - Default Strength: 100Ω Termination
    - 2x Strength: 50Ω Termination
  - 1.8V Parallel CMOS Interface Also Supported
- **Programmable Gain for SNR/SFDR Trade-Off**
- **DC Offset Correction**
- **Supports Low Input Clock Amplitude**
- Package: QFN-48 (7mm × 7mm)

### DESCRIPTION

The ADS58B18/B19 are members of the ultralow power ADS4xxx analog-to-digital converter (ADC) family that features integrated analog buffers and SNRBoost technology. The ADS58B18 ADS58B19 are 11-bit and 9-bit ADCs with sampling rates up to 200MSPS and 250MSPS, respectively. Innovative design techniques are used to achieve dynamic performance while consuming extremely low power. The analog input pins have buffers with constant performance and input impedance across a wide frequency range. This architecture makes these parts well-suited for multi-carrier, wide bandwidth communications applications such as PA linearization.

The ADS58B18 uses TI-proprietary SNRBoost technology that can be used to overcome SNR limitation as a result of quantization noise for bandwidths less than Nyquist (f<sub>S</sub>/2).

Both devices have gain options that can be used to improve SFDR performance at lower full-scale input ranges, especially at very high input frequencies. They also include a dc offset correction loop that can be used to cancel the ADC offset. At lower sampling rates, the ADC automatically operates at scaled-down power with no loss in performance.

These devices support both double data rate (DDR) low-voltage differential signaling (LVDS) and parallel CMOS digital output interfaces. The low data rate of the DDR LVDS interface (maximum 500Mbps) makes it possible to use low-cost field-programmable gate array (FPGA)-based receivers. They have a low-swing LVDS mode that can be used to further reduce the power consumption. The strength of the LVDS output buffers can also be increased to support 50Ω differential termination.

The ADS58B18/B19 are both available in a compact QFN-48 package and specified over the industrial temperature range (-40°C to +85°C).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments Incorporated. All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) When AVDD is turned off, it is recommended to switch off the input clock (or ensure the voltage on CLKP, CLKM is less than |0.3V|. Doing so prevents the ESD protection diodes at the clock input pins from turning on.

# **ELECTRICAL CHARACTERISTICS: ADS58B18/ADS58B19**

Typical values are at +25°C, AVDD = 1.8V, AVDD\_BUF = 3.3V, DRVDD = 1.8V, 50% clock duty cycle, -1dBFS differential analog input, and DDR LVDS interface, unless otherwise noted. Minimum and maximum values are across the full temperature range:

 $T_{MIN} = -40$ °C to  $T_{MAX} = +85$ °C, AVDD = 1.8V, and DRVDD = 1.8V.

| TMIN = TO C to TMAX = TOC C, AVE                   |  | ADS58B18 |       |      |      |       |      |                 |

# **ELECTRICAL CHARACTERISTICS: GENERAL**

Typical values are at +25°C, AVDD = 1.8V, DRVDD = 1.8V, 50% clock duty cycle, and 0dB gain, unless otherwise noted. Minimum and maximum values are across the full temperature range:  $T_{MIN} = -40$ °C to  $T_{MAX} = +85$ °C, AVDD = 1.8V, and DRVDD = 1.8V.

| Global power-down  |          | 10    | 35  |     | 10    | 35  | mW              |
| Standby  |          | 185   |     |     | 185   |     | mW              |

<sup>(1)</sup> The maximum DRVDD current with CMOS interface depends on the actual load capacitance on the digital output lines. Note that the maximum recommended load capacitance on each digital output line is 10pF.

<sup>(2)</sup> In CMOS mode, the DRVDD current scales with the sampling frequency, the load capacitance on output pins, input frequency, and the supply voltage (see the CMOS Interface Power Dissipation section in the Application Information).

# **DIGITAL CHARACTERISTICS**

The dc specifications refer to the condition where the digital outputs are not switching but are permanently at a valid logic level '0' or '1'. AVDD = 1.8V and DRVDD = 1.8V.

| PIN NAME | PIN NUMBER            | # OF<br>PINS | FUNCTION | DESCRIPTION   |
|----------|-----------------------|--------------|----------|---|
| AVDD     | 8, 18, 20, 22, 24, 26 | 6            | I        | 1.8V analog power supply  |
| AVDD_BUF | 21                    | 1            | 1        | 3.3V input buffer supply  |
| AGND     | 9, 12, 14, 17, 19, 25 | 6            | 1        | Analog ground   |
| CLKP     | 10                    | 1            | 1        | Differential clock input, positive  |
| CLKM     | 11                    | 1            | I        | Differential clock input, negative  |
| INP      | 15                    | 1            | I        | Differential analog input, positive   |
| INM      | 16                    | 1            | I        | Differential analog input, negative   |
| VCM      | 13                    | 1            | 0        | Outputs the common-mode voltage that can be used externally to bias the analog input pins.  |
| RESET    | 30                    | 1            | I        | Serial interface RESET input. When using the serial interface mode, the internal registers must initialize through hardware RESET by applying a high pulse on this pin or by using the software reset option; refer to the Serial Interface section. When RESET is tied high, the internal registers are reset to the default values. In this condition, SEN can be used as an analog control pin. RESET has an internal $180k\Omega$ pull-down resistor. |
| SCLK     | 29                    | 1            | I        | This pin functions as a serial interface clock input when RESET is low. When RESET is high, SCLK has no function and should be tied to ground. This pin has an internal $180 k\Omega$ pull-down resistor.   |
| SDATA    | 28                    | 1            | I        | This pin functions as a serial interface data input when RESET is low. When RESET is high, SDATA functions as a STANDBY control pin (see Table 7). This pin has an internal $180k\Omega$ pull-down resistor.  |
| SEN      | 27                    | 1            | I        | This pin functions as a serial interface enable input when RESET is low. When RESET is high, SEN has no function and should be tied to AVDD. This pin has an internal $180 \mathrm{k}\Omega$ pull-up resistor to AVDD.  |

| AGND     | 9, 12, 14, 17, 19, 25 | 6            | I        | Analog ground  |
| CLKP     | 10                    | 1            | 1        | Differential clock input, positive   |
| CLKM     | 11                    | 1            | 1        | Differential clock input, negative   |
| INP      | 15                    | 1            | 1        | Differential analog input, positive  |
| INM      | 16                    | 1            | I        | Differential analog input, negative  |
| VCM      | 13                    | 1            | 0        | Outputs the common-mode voltage that can be used externally to bias the analog input pins.   |
| RESET    | 30                    | 1            | I        | Serial interface RESET input. When using the serial interface mode, the internal registers must initialize through hardware RESET by applying a high pulse on this pin or by using the software reset option; refer to the Serial Interface section. When RESET is tied high, the internal registers are reset to the default values. In this condition, SEN can be used as an analog control pin. RESET has an internal $180 k\Omega$ pull-down resistor. |
| SCLK     | 29                    | 1            | I        | This pin functions as a serial interface clock input when RESET is low. When RESET is high, SCLK has no function and should be tied to ground. This pin has an internal $180 k\Omega$ pull-down resistor.  |
| SDATA    | 28                    | 1            | I        | This pin functions as a serial interface data input when RESET is low. When RESET is high, SDATA functions as a STANDBY control pin (see Table 7). This pin has an internal $180k\Omega$ pull-down resistor.   |
| SEN      | 27                    | 1            | I        | This pin functions as a serial interface enable input when RESET is low. When RESET is high, SEN has no function and should be tied to AVDD. This pin has an internal $180 k\Omega$ pull-up resistor to AVDD.  |

|                  | ADC latency <sup>(5)</sup>     | Gain and offset correction enabled  |      | 17   |     | Clock<br>cycles    |
| DDR L            | VDS MODE <sup>(6)</sup>        |   |      |      |     |                    |
| t <sub>SU</sub>  | Data setup time <sup>(7)</sup> | Data valid to zero-crossing of CLKOUTP  | 0.75 | 1.1  |     | ns                 |
| t <sub>H</sub>   | Data hold time <sup>(7)</sup>  | Zero-crossing of CLKOUTP to data becoming invalid   | 0.35 | 0.6  |     | ns                 |
| t <sub>PDI</sub> | Clock propagation delay        | Input clock rising edge cross-over to output clock rising edge cross-over  1MSPS ≤ sampling frequency ≤ 250MSPS | 3    | 4.2  | 5.4 | ns                 |
|                  | Variation of t <sub>PDI</sub>  | Between two devices at the same temperature and DRVDD supply  |      | ±0.6 |     | ns                 |

- (1) Timing parameters are ensured by design and characterization but are not production tested.
- (2) C<sub>LOAD</sub> is the effective external single-ended load capacitance between each output pin and ground.
- (3) R<sub>LOAD</sub> is the differential load resistance between the LVDS output pair.
- (4) This parameter is specified by design.
- (5) At higher frequencies, t<sub>PDI</sub> is greater than one clock period and overall latency = ADC latency + 1.
- (6) Measurements are done with a transmission line of 100Ω characteristic impedance between the device and the load. Setup and hold time specifications take into account the effect of jitter on the output data and clock.
- (7) Data valid refers to a logic high of +100mV and a logic low of -100mV.

# TIMING REQUIREMENTS: LVDS and CMOS Modes<sup>(1)</sup> (continued)

Typical values are at +25°C, AVDD = 1.8V, DRVDD = 1.8V, sampling frequency = 250 MSPS, sine wave input clock,  $C_{LOAD}$  = 5pF<sup>(2)</sup>, and  $R_{LOAD}$  = 100 $\Omega^{(3)}$ , unless otherwise noted. - (1) At higher sampling frequencies, t<sub>DPI</sub> is greater than one clock cycle, which then makes the overall latency = ADC latency + 1.
- (2) E = Even bits (D0, D2, D4, etc). O = Odd bits (D1, D3, D5, etc).

Figure 8. Latency Diagram

(1) Dn = bits D0, D2, D4, etc. Dn + 1 = Bits D1, D3, D5, etc.

Figure 9. LVDS Mode Timing

Dn = bits D0, D1, D2, etc.

Figure 10. CMOS Mode Timing

#### **DEVICE CONFIGURATION**

The ADS58B18/9 have several modes that can be configured using a serial programming interface, as described in Table 4 through Table 7. In addition, the devices have three dedicated parallel pins for quickly configuring commonly-used functions. The parallel pins are DFS (analog 4-level control pin), OE (digital control pin), and SNRBoost\_En (digital control pin). The analog control pin can be easily configured using a simple resistor divider (with 10% tolerance resistors).

Table 4. DFS: Analog Control Pin

| VOLTAGE APPLIED ON DFS | DESCRIPTION (Data Format/Output Interface) |
|------------------------|--|
| 0, +100mV/–0mV         | Twos complement/DDR LVDS                   |
| (3/8) AVDD ± 100mV     | Twos complement/parallel CMOS              |
| (5/8) AVDD ± 100mV     | Straight binary/parallel CMOS              |
| AVDD, +0mV/-100mV      | Straight binary/DDR LVDS                   |

### Table 5. OE: Digital Control Pin

| VOLTAGE APPLIED ON OE | DESCRIPTION                  |
|-----------------------|------------------------------|
| 0                     | Output data buffers disabled |
| AVDD                  | Output data buffers enabled  |

Table 6. SNRBoost\_En: Digital Control Pin (ADS58B18 Only)

| VOLTAGE APPLIED ON SNRBoost_En | DESCRIPTION       |
|--------------------------------|-------------------|
| 0                              | SNRBoost disabled |
| Logic high                     | SNRBoost enabled  |

When the serial interface is not used, the SDATA pin can also be used as a standby control pin. To enable this, the RESET pin must be tied high.

# Table 7. SDATA: Digital Control Pin

| VOLTAGE APPLIED ON SDATA | DESCRIPTION           |
|--------------------------|-----------------------|
| 0                        | Normal operation      |
| Logic high               | Device enters standby |

Figure 11. Simplified Diagram to Configure DFS Pin

#### **SERIAL INTERFACE**

The analog-to-digital converter (ADC) has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock), and SDATA (serial interface data) pins. When SEN is low, the serial shift of bits into the device is enabled, the serial data (on SDATA) are latched at every falling edge of SCLK, and the serial data are loaded into the register at every 16th SCLK falling edge.

In case the word length exceeds a multiple of 16 bits, the excess bits are ignored. Data can be loaded in multiples of 16-bit words within a single active SEN pulse. The first eight bits form the register address and the remaining eight bits are the register data. The interface can work with SCLK frequency from 20MHz down to very low speeds (a few hertz) and also with non-50% SCLK duty cycle.

### **Register Initialization**

After power-up, the internal registers must be initialized to the default values. This initialization can be accomplished in one of two ways:

- 1. Either through hardware reset by applying a high pulse on the RESET pin (of width greater than 10ns), as shown in Figure 12; or
- By applying a software reset. When using the serial interface, set the RESET bit (D7 in register 00h) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is held low.

Figure 12. Serial Interface Timing

### SERIAL INTERFACE TIMING CHARACTERISTICS

Typical values at +25°C, minimum and maximum values across the full temperature range:  $T_{MIN} = -40$ °C to  $T_{MAX} = +85$ °C, AVDD = 1.8V, and DRVDD = 1.8V, unless otherwise noted.

|                     | PARAMETER                                      | MIN  | TYP | MAX | UNIT |
|---------------------|--|------|-----|-----|------|
| f <sub>SCLK</sub>   | SCLK frequency (equal to 1/t <sub>SCLK</sub> ) | > DC |     | 20  | MHz  |
| t <sub>SLOADS</sub> | SEN to SCLK setup time                         | 25   |     |     | ns   |
| t <sub>SLOADH</sub> | SCLK to SEN hold time                          | 25   |     |     | ns   |
| t <sub>DSU</sub>    | SDATA setup time                               | 25   |     |     | ns   |
| t <sub>DH</sub>     | SDATA hold time                                | 25   |     |     | ns   |

# Serial Register Readout

The device includes a mode where the contents of the internal registers can be read back on the OVR\_SDOUT pin. This readback may be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC.

After power-up and device reset, the OVR\_SDOUT pin functions as an over-range indicator pin by default. When the readout mode is enabled, OVR\_SDOUT outputs the contents of the selected register serially. OVR\_SDOUT is a CMOS logic output buffer that runs off the DRVDD supply.

- 1. Set the READOUT register bit to '1'. This setting puts the device in serial readout mode and disables any further writes to the internal registers **except** the register at address 0. Note that the READOUT bit itself is also located in register 0. The device can exit readout mode by writing READOUT to 0. Only the contents of the register at address 0 cannot be read in the register readout mode.
- 2. Initiate a serial interface cycle specifying the address of the register (A7 to A0) whose content must be read.
- 3. The device serially outputs the contents (D7 to D0) of the selected register on the OVR SDOUT pin.
- 4. The external controller can latch the contents at the falling edge of SCLK.
- 5. To exit the serial readout mode, the reset register bit READOUT = 0 enables writes into all registers of the device. At this point, the OVR\_SDOUT pin becomes an over-range indicator pin.

### a) Enable serial readout (READOUT = 1)

= '

b) Read contents of register 0x43. This register has been initialized with 0x40 (device is put in global power-down mode).

- (1) The OVR\_SDOUT pin finctions as OVR (READOUT = 0).
- (2) The OVR SDOUT pin finctions as a serial readout (READOUT = 1).

Figure 13. Serial Readout Timing Diagram

# **SERIAL REGISTER MAP**

Table 8 summarizes the functions supported by the serial interface.

# Table 8. Serial Interface Register Map<sup>(1)</sup>

| REGISTER<br>ADDRESS | DEFAULT VALUE<br>AFTER RESET |                                 |               |                          | REGISTE            | ER DATA                  |                  |                            |                          |

<sup>(1)</sup> Multiple functions in a register can be programmed in a single write operation.

# **DESCRIPTION OF SERIAL REGISTERS**

# Register Address 00h (Default = 00h)

| 7 | 6 | 5 | 4 | 3 | 2 | 1     | 0       |
|---|---|---|---|---|---|-------|---------|
| 0 | 0 | 0 | 0 | 0 | 0 | RESET | READOUT |

Bits[7:2] Always write '0'

Bit 1 RESET: Software reset applied

This bit resets all internal registers to the default values and self-clears to 0 (default = 1).

Bit 0 READOUT: Serial readout

This bit sets the serial readout of the registers.

0 = Serial readout of registers disabled; the OVR\_SDOUT pin functions as an over-voltage indicator.

1 = Serial readout enabled; the OVR\_SDOUT pin functions as a serial data readout. See the *Serial Register Readout* section.

# Register Address 01h (Default = 00h)

| 7 | 6 | 5    | 4     | 3 | 2 | 1 | 0 |
|---|---|------|-------|---|---|---|---|
|   |   | LVDS | SWING |   |   | 0 | 0 |

# Bits[7:2] LVDS SWING: LVDS swing programmability<sup>(1)</sup>

000000 = Default LVDS swing; ±350mV with external 100Ω termination

011011 = LVDS swing increases to ±410mV

110010 = LVDS swing increases to ±465mV

010100 = LVDS swing increases to ±570mV

111110 = LVDS swing decreases to ±200mV

001111 = LVDS swing decreases to ±125mV

### Bits[1:0] Always write '0'

(1) The EN LVDS SWING register bits must be set to enable LVDS swing control.

# Register Address 25h (Default = 00h)

| 7 | 6  | 5   | 4 | 3 | 2 | 1             | 0 |
|---|----|-----|---|---|---|---------------|---|
|   | G/ | AIN |   | 0 |   | TEST PATTERNS |   |

### Bits[7:4] GAIN: Gain programmability

These bits set the gain programmability in 0.5dB steps.

0000 = 0dB gain (default after reset)

0110 = 0.5 dB gain

0111 = 1dB gain

1000 = 1.5 dB gain

1001 = 2dB gain

1010 = 2.5 dB gain

1011 = 3dB gain

1100 = 3.5 dB gain

### Bit 3 Always write '0'

### Bits[2:0] TEST PATTERNS: Data capture

These bits can be used to verify data capture.

000 = Normal operation

001 = Outputs all 0s

010 = Outputs all 1s

011 = Outputs toggle pattern

In the ADS58B18, output data D[10:0] are an alternating sequence of 01010101010 and 10101010101.

In the ADS58B19, output data D[8:0] are an alternating sequence of 010101010 and 101010101.

100 = Outputs digital ramp

Output data increments by one LSB (11-bit) every eighth clock cycle from code 0 to code 2047

101 = Output custom pattern (use registers 3Fh and 40h for setting the custom pattern)

110 = Unused

111 = Unused

### Register Address 26h (Default = 00h)

| 7 | 6 | 5 | 4 | 3 | 2 | 1                       | 0                     |
|---|---|---|---|---|---|-------------------------|-----------------------|
| 0 | 0 | 0 | 0 | 0 | 0 | LVDS CLKOUT<br>STRENGTH | LVDS DATA<br>STRENGTH |

# Bits[7:2] Always write '0'

### Bit 1 LVDS CLKOUT STRENGTH: LVDS output clock buffer strength

This bit determines the external termination to be used with the LVDS output clock buffer.

 $0 = 100\Omega$  external termination (default strength)

 $1 = 50\Omega$  external termination (2x strength)

# Bit 0 LVDS DATA STRENGTH: LVDS data buffer strength

This bit determines the external termination to be used with all of the LVDS data buffers.

 $0 = 100\Omega$  external termination (default strength)

 $1 = 50\Omega$  external termination (2x strength)

01 = DDR LVDS interface

11 = Parallel CMOS interface

### Bits[5:4] CMOS CLKOUT STRENGTH

Controls strength of CMOS output clock only.

00 = Maximum strength (recommended and used for specified timings)

01 = Medium strength

10 = Low strength

11 = Very low strength

# Bit 3 ENABLE CLKOUT RISE

0 = Disables control of output clock rising edge

1 = Enables control of output clock rising edge

# Bits[2:1] CLKOUT RISE POSN: CLKOUT rise control

Controls position of output clock rising edge

LVDS interface:

00 = Default position (timings are specified in this condition)

01 = Setup reduces by 500ps, hold increases by 500ps

10 = Data transition is aligned with rising edge

11 = Setup reduces by 200ps, hold increases by 200ps

CMOS interface:

00 = Default position (timings are specified in this condition)

01 = Setup reduces by 100ps, hold increases by 100ps

10 = Setup reduces by 200ps, hold increases by 200ps

11 = Setup reduces by 1.5ns, hold increases by 1.5ns

### Bit 0 ENABLE CLKOUT FALL

0 = Disables control of output clock fall edge

1 = Enables control of output clock fall edge

# Register Address 42h (Default = 00h)

| 7         | 6        | 5 | 4 | 3                  | 2    | 1 | 0            |

#### **APPLICATION INFORMATION**

#### THEORY OF OPERATION

The ADS58B18 and ADS58B19 are members of the ultralow power ADS4xxx analog-to-digital converter (ADC) family with integrated analog buffers and SNRBoost technology. The analog-to-digital conversion process is initiated by a rising edge of the external input clock when the analog input signal is sampled. The sampled signal is sequentially converted by a series of small resolution stages with the outputs combined in a digital correction logic block. At every clock edge the sample propagates through the pipeline, resulting in a data latency of 10 clock cycles. The output is available as 11-bit data (ADS58B18) or 9-bit data (ADS58B19), in DDR LVDS or CMOS, and coded in either offset binary or binary twos complement format.

## **ANALOG INPUT**

The analog inputs include an analog buffer (powered by the AVDD\_BUF supply) that internally drives the differential sampling circuit. As a result of the analog buffer, the input pins present high input impedance to the external driving source ( $10k\Omega$  dc resistance and 2pF input capacitance).

The buffer helps to isolate the external driving source from the switching currents of the sampling circuit. With a constant input impedance, the ADC is easier to drive and to reproduce data sheet measurements. For wideband applications (such as power amplifier linearization) the signal gain across frequency is more consistent. Spectral performance variation across the sampling frequency is also reduced.

The input common-mode is set internally using a  $5k\Omega$  resistor from each input pin to 1.7V, so the input signal can be ac-coupled to the pins. For a full-scale differential input, each input pin (INP, INM) must swing symmetrically between  $V_{CM}$  + 0.375V and  $V_{CM}$  – 0.375V, resulting in a 1.5V<sub>PP</sub> differential input swing. The input sampling circuit has a high 3dB bandwidth that extends up to 550MHz (measured from the input pins to the sampled voltage). Figure 58 shows an equivalent circuit for the analog input.

Figure 58. Analog Input Equivalent Circuit

# **Drive Circuit Requirements**

The primary advantage of the buffered analog inputs is the isolation of the external drive source from the switching currents of the sampling circuit. The filtering of the glitches with an external R-C-R filter, as suggested for the ADS4149 family, is not required. Using a simple drive circuit, it is possible to obtain uniform performance over a wide frequency range.

For optimum performance, the analog inputs must be driven differentially. This configuration improves the common-mode noise immunity and even-order harmonic rejection. A small resistor ( $5\Omega$  to  $10\Omega$ ) in series with each input pin is recommended to damp out ringing caused by package parasitics.

Figure 59 and Figure 60 show the differential impedance ( $Z_{IN} = R_{IN} \parallel C_{IN}$ ) seen by looking into the ADC input pins. The presence of the analog input buffer results in an almost constant input capacitance up to 1GHz.

Figure 59. ADC Analog Input Resistance (R<sub>IN</sub>) Across Frequency

Figure 60. ADC Analog Input Capacitance (CIN) Across Frequency

# **Driving Circuit**

Two example driving circuit configurations are shown in Figure 61 and Figure 62—one optimized for low input frequencies and the other optimized for high input frequencies. Notice in both cases that the board circuitry is simplified compared to the non-buffered ADS4149.

In Figure 61, a single transformer is used and is suited for low input frequencies. To optimize even-harmonic performance at high input frequencies (greater than the first Nyquist), the use of back-to-back transformers is recommended (see Figure 62). Note that both drive circuits have been terminated by  $50\Omega$  near the ADC side. The ac-coupling capacitors allow the analog inputs to self-bias around the required common-mode voltage.

Figure 61. Drive Circuit for Low Input Frequencies

Figure 62. Drive Circuit for High Input Frequencies

The mismatch in the transformer parasitic capacitance (between the windings) results in degraded even-order harmonic performance. Connecting two identical RF transformers back-to-back helps minimize this mismatch and good performance is obtained for high-frequency input signals. An additional termination resistor pair may be required between the two transformers, as shown in Figure 61 and Figure 62. The center point of this termination is connected to ground to improve the balance between the P (positive) and M (negative) sides. The values of the terminations between the transformers and on the secondary side must be chosen to obtain an effective  $50\Omega$  (for a  $50\Omega$  source impedance).

#### **CLOCK INPUT**

The ADS58B18/19 clock inputs can be driven differentially (sine, LVPECL, or LVDS) or single-ended (LVCMOS), with little or no difference in performance. The common-mode voltage of the clock inputs is set to VCM using internal  $5k\Omega$  resistors. This setting allows the use of transformer-coupled drive circuits for sine-wave clock or ac-coupling for LVPECL and LVDS clock sources. Figure 63 shows a circuit for the internal clock buffer.

NOTE: C<sub>FO</sub> is 1pF to 3pF and is the equivalent input capacitance of the clock buffer.

Figure 63. Internal Clock Buffer

A single-ended CMOS clock can be ac-coupled to the CLKP input, with CLKM connected to ground with a 0.1µF capacitor, as shown in Figure 64. For best performance, the clock inputs must be driven differentially, reducing susceptibility to common-mode noise. For high input frequency sampling, it is recommended to use a clock source with very low jitter. Band-pass filtering of the clock source can help reduce the effects of jitter. There is no change in performance with a non-50% duty cycle clock input (see Figure 34). Figure 65 shows a differential circuit.

Figure 64. Single-Ended Clock Driving Circuit

Figure 65. Differential Clock Driving Circuit

# SNR ENHANCEMENT USING SNRBoost (ADS58B18 ONLY)

SNRBoost technology makes it possible to overcome SNR limitations resulting from quantization noise. Using SNRBoost, enhanced SNR can be obtained for any bandwidth (less than Nyquist or  $f_S/2$ ; see Table 4). SNR improvement is achieved without affecting the default harmonic performance.

SNRBoost can be enabled using the SNRBoost\_EN pin or via register bits. When SNRBoost is enabled, the noise floor in the spectrum acquires a typical *bathtub* shape; see Figure 66. The bathtub is centered around a specific frequency (called *center frequency*). The center frequency is located midway between two corner frequencies that are specified by the SNRBoost coefficients (register bits SNRBoost Coeff1 and SNRBoost Coeff2).

Figure 66. Spectrum with SNRBoost Enabled

Table 9 shows the relation between each coefficient and its corner frequency. By choosing appropriate coefficients, the bathtub can be positioned over the frequency range of 0 to  $f_S/2$  (Table 10 shows some examples). By positioning the bathtub within the desired signal band, SNR improvement can be achieved (see Table 4). Note that as the bandwidth is increased, the amount of SNR improvement reduces.

After a reset, the device is in low-latency disabled mode. To use the SNRBoost:

- For the required bathtub position, write the appropriate coefficients in the SNRBoost Coeff1 and SNRBoost Coeff2 registers
- SNRBoost can be enabled or disabled using the SNRBoost\_EN digital input pin. This pin has higher priority
  over the SNRBoost Enable1 and SNRBoost Enable2 register bits
- To use the enable register bits, set the override bit (OVER\_RIDE SNRBoost pin).

**Table 9. Setting the Corner Frequency** 

| SNRBoost COEFFICIENT VALUE | NORMALIZED CORNER<br>FREQUENCY (f/f <sub>S</sub> ) | SNRBoost COEFFICIENT VALUE | NORMALIZED CORNER<br>FREQUENCY (f/f <sub>s</sub> ) |

## GAIN FOR SFDR/SNR TRADE-OFF

The ADS58B18/19 include gain settings that can be used to get improved SFDR performance. The gain is programmable from 0dB to 3.5dB (in 0.5dB steps) using the GAIN register bits. For each gain setting, the analog input full-scale range scales proportionally, as shown in Table 11.

The SFDR improvement is achieved at the expense of SNR; for each gain setting, the SNR degrades approximately between 0.5dB and 1dB. The SNR degradation is reduced at high input frequencies. As a result, the gain is very useful at high input frequencies because the SFDR improvement is significant with marginal degradation in SNR. Therefore, the gain can be used to trade-off between SFDR and SNR.

After a reset, the device is in low-latency disabled mode and gain is enabled with 0dB gain. For other gain settings, program the GAIN bits.

**Table 11. Full-Scale Range Across Gains** 

| GAIN (dB) | ТҮРЕ                | FULL-SCALE (V <sub>PP</sub> ) |
|-----------|---------------------|-------------------------------|
| 0         | Default after reset | 1.5                           |
| 0.5       |                     | 1.41                          |

# **OFFSET CORRECTION**

The ADS58B18/19 has an internal offset corretion algorithm that estimates and corrects dc offset up to ±10mV. The correction can be enabled using the ENABLE OFFSET CORR serial register bit. Once enabled, the algorithm estimates the channel offset and applies the correction every clock cycle. The time constant of the correction loop is a function of the sampling clock frequency. The time constant can be controlled using the OFFSET CORR TIME CONSTANT register bits, as described in Table 12.

Table 12. Time Constant of Offset Correction Loop

| OFFSET CORR TIME CONSTANT | TIME CONSTANT, TC <sub>CLK</sub><br>(Number of Clock Cycles) | TIME CONSTANT, TC <sub>CLK</sub> × 1/f <sub>S</sub> (sec) <sup>(1)</sup> |
|---------------------------|--|--|
| 0000                      | 1M   | 5ms  |

<sup>(1)</sup> Sampling frequency,  $f_S = 250MSPS$ .

After the offset is estimated, the correction can be frozen by setting FREEZE OFFSET CORR = 1. Once frozen, the last estimated value is used for the offset correction of every clock cycle. Note that offset correction is disabled by default after reset.

After a reset, the device is in low-latency disabled mode. To use offset correction, set ENABLE OFFSET CORR to '1' and program the required time constant.

#### **POWER DOWN**

The ADS58B18/19 has three power-down modes: power-down global, standby, and output buffer disable.

#### **Power-Down Global**

In this mode, the entire chip (including the ADC, internal reference, and the output buffers) are powered down, resulting in reduced total power dissipation of about 10mW. The output buffers are in a high-impedance state. The wake-up time from the global power-down to data becoming valid in normal mode is typically 100µs. To enter the global power-down mode, set the PDN GLOBAL register bit.

# Standby

In this mode, only the ADC is powered down and the internal references are active, resulting in a fast wake-up time of 5µs. The total power dissipation in standby mode is approximately 185mW. To enter the standby mode, set the STANDBY register bit.

# **Output Buffer Disable**

The output buffers can be disabled and put in a high-impedance state; wakeup time from this mode is fast, approximately 100ns. This can be controlled using the PDN OBUF register bit or using the OE pin.

# **Input Clock Stop**

In addition, the converter enters a low-power mode when the input clock frequency falls below 1MSPS. The power dissipation is approximately 80mW.

# **POWER-SUPPLY SEQUENCE**

During power-up, the AVDD and DRVDD supplies can come up in any sequence. The two supplies are separated in the device. Externally, they can be driven from separate supplies or from a single supply.

#### DIGITAL OUTPUT INFORMATION

The ADS58B18/19 provide either 11-bit or 9-bit data and an output clock synchronized with the data.

## **Output Interface**

Two output interface options are available: double data rate (DDR) LVDS and parallel CMOS. The output can be selected using the LVDS CMOS serial interface register bit or using the DFS pin. The DFS pin has higher priority for deciding the type of interface, unless the LVDS CMOS override bit is set.

# **DDR LVDS Outputs**

In this mode, the data bits and clock are output using low voltage differential signal (LVDS) levels. Two data bits are multiplexed and output on each LVDS differential pair, as shown in Figure 67 and Figure 68. Two bit order options are available: bit-wise sequence (default) and byte-wise sequence. Byte-wise sequence can be programmed with the BYTE-WISE En Register bit.

Pins CLKOUTP Output Clock CLKOUTM -○ D0 P ► Data Bits D0 -○ D0 M LVDS Buffers → D1 D2 P - Data Bits D1, D2 -○ D1\_D2\_M -○ D3 D4 P - Data Bits D3, D4 9-Bit -0 D3 D4 M ADC Data -○ D5\_D6 P ► Data Bits D5, D6 -○ D5 D6 M → D7 D8 P Data Bits D7. D8 → D7\_D8\_M ADS58B19

Figure 67. ADS58B18 LVDS Outputs

Figure 68. ADS58B19 LVDS Outputs

# **Bit-Wise Sequence**

Even data bits (D0, D2, D4, etc) are output at the rising edge of CLKOUTP and the odd data bits (D1, D3, D5, etc) are output at the falling edge of CLKOUTP. Both the rising and falling edges of CLKOUTP must be used to capture all the data bits; see Figure 69.

# Byte-Wise Sequence

In the ADS58B18, data bits D[0:4] are output at the falling edge of CLKOUTP and data bits D[5:10] are output at the rising edge of CLKOUTP. Both the rising and falling edges of CLKOUTP must be used to capture all the data bits; see Figure 70.

In the ADS58B19, data bits D[0:3] are output at the falling edge of CLKOUTP and data bits D[4:8] are output at the rising edge of CLKOUTP. Both the rising and falling edges of CLKOUTP must be used to capture all the data bits; see Figure 71.

(1) Bits D9 and D10 are only available in the ADS58B18.

Figure 69. Bit-Wise Sequence (Only with DDR LVDS Interface)

Figure 70. ADS58B18 Byte-Wise Sequence (Only with DDR LVDS Interface)

Figure 71. ADS58B19 Byte-Wise Sequence (Only with DDR LVDS Interface)

# LVDS Output Data and Clock Buffers

The equivalent circuit of each LVDS output buffer is shown in Figure 72. After reset, the buffer presents an output impedance of  $100\Omega$  to match with the external  $100\Omega$  termination.

Additionally, a mode exists to double the strength of the LVDS buffer to support  $50\Omega$  differential termination. This mode can be used when the output LVDS signal is routed to two separate receiver chips, each using a  $100\Omega$  termination. The mode can be enabled using the LVDS DATA STRENGTH and LVDS CLKOUT STRENGTH register bits for data and output clock buffers, respectively.

The buffer output impedance behaves in the same way as a source-side series termination. By absorbing reflections from the receiver end, it helps to improve signal integrity.

Figure 72. LVDS Buffer Equivalent Circuit

#### **Parallel CMOS Interface**

In CMOS mode, each data bit is output on a separate pin as the CMOS voltage level, for every clock cycle. The rising edge of the output clock CLKOUT can be used to latch data in the receiver. Figure 73 depicts the CMOS output interface.

Switching noise (caused by CMOS output data transitions) can couple into the analog inputs and degrade SNR. The coupling and SNR degradation increases as the output buffer drive is made stronger. To minimize this degradation, the CMOS output buffers are designed with controlled drive strength. The default drive strength ensures a wide data stable window (even at 250MSPS) is provided so the data outputs have minimal load capacitance. It is recommended to use short traces (1 to 2 inches, or 2,54cm to 5,08cm) terminated with less than 5pF load capacitance, as shown in Figure 74.

For sampling frequencies greater than 200MSPS, it is recommended to use an external clock to capture data. The delay from input clock to output data and the data valid times are specified for higher sampling frequencies. These timings can be used to delay the input clock appropriately and use it to capture data.

Figure 73. CMOS Output Interface

Figure 74. CMOS Capture Example

# **CMOS Interface Power Dissipation**

With CMOS outputs, the DRVDD current scales with the sampling frequency and the load capacitance on every output pin. The maximum DRVDD current occurs when each output bit toggles between '0' and '1' every clock cycle. In actual applications, this condition is unlikely to occur. The actual DRVDD current would be determined by the average number of output bits switching, which is a function of the sampling frequency and the nature of the analog input signal.

Digital Current as a Result of CMOS Output Switching = C<sub>L</sub> × DRVDD × (N × f<sub>AVG</sub>)

where:

C<sub>L</sub> = load capacitance,

 $N \times F_{AVG}$  = average number of output bits switching. (1)

# Input Over-Voltage Indication (OVR\_SDOUT Pin)

The device has an OVR\_SDOUT pin that provides information about analog input overload (as long as the READOUT register bit is '0'). When the READOUT bit is '1', it functions as a serial readout pin.

At any clock cycle, if the sampled input voltage exceeds the positive or negative full-scale range, the OVR pin goes high. The OVR remains high as long as the overload condition persists. The OVR pin is a CMOS output buffer (running off DRVDD supply), independent of the type of output data interface (DDR LVDS or CMOS).

For a positive overload, the D[10:0] output data bits are 7FFh in offset binary output format and 3FFh in twos complement output format. For a negative input overload, the output code is 000h in offset binary output format and 400h in twos complement output format.

# **Output Data Format**

Two output data formats are supported: twos complement and offset binary. They can be selected using the DATA FORMAT serial interface register bit or using the DFS pin.

#### **BOARD DESIGN CONSIDERATIONS**

# Grounding

A single ground plane is sufficient to give good performance, provided the analog, digital, and clock sections of the board are cleanly partitioned. See the *ADS414x*, *ADS412x EVM User Guide* (SLWU067) for details on layout and grounding.

## **Supply Decoupling**

Because the ADS58B18/19 already include internal decoupling, minimal external decoupling can be used without loss in performance. Note that decoupling capacitors can help filter external power-supply noise, so the optimum number of capacitors depends on the actual application. The decoupling capacitors should be placed very close to the converter supply pins.

## **Exposed Pad**

In addition to providing a path for heat dissipation, the PowerPAD is also electrically internally connected to the digital ground. Therefore, it is necessary to solder the exposed pad to the ground plane for best thermal and electrical performance. For detailed information, see application notes *QFN Layout Guidelines* (SLOA122) and *QFN/SON PCB Attachment* (SLUA271), both available for download at the TI web site (www.ti.com).

#### **DEFINITION OF SPECIFICATIONS**

**Analog Bandwidth** – The analog input frequency at which the power of the fundamental is reduced by 3dB with respect to the low-frequency value.

**Aperture Delay** – The delay in time between the rising edge of the input sampling clock and the actual time at which the sampling occurs. This delay is different across channels. The maximum variation is specified as aperture delay variation (channel-to-channel).

Aperture Uncertainty (Jitter) - The sample-to-sample variation in aperture delay.

Clock Pulse Width/Duty Cycle – The duty cycle of a clock signal is the ratio of the time the clock signal remains at a logic high (clock pulse width) to the period of the clock signal. Duty cycle is typically expressed as a percentage. A perfect differential sine-wave clock results in a 50% duty cycle.

**Maximum Conversion Rate** – The maximum sampling rate at which specified operation is given. All parametric testing is performed at this sampling rate unless otherwise noted.

Minimum Conversion Rate - The minimum sampling rate at which the ADC functions.

**Differential Nonlinearity (DNL)** – An ideal ADC exhibits code transitions at analog input values spaced exactly 1LSB apart. The DNL is the deviation of any single step from this ideal value, measured in units of LSBs.

**Integral Nonlinearity (INL)** – The INL is the deviation of the ADC transfer function from a best fit line determined by a least squares curve fit of that transfer function, measured in units of LSBs.

**Gain Error** – Gain error is the deviation of the ADC actual input full-scale range from its ideal value. The gain error is given as a percentage of the ideal input full-scale range. Gain error has two components: error as a result of reference inaccuracy and error as a result of the channel. Both errors are specified independently as  $E_{GREF}$  and  $E_{GCHAN}$ .

To a first-order approximation, the total gain error is  $E_{TOTAL} \sim E_{GREF} + E_{GCHAN}$ .

For example, if  $E_{TOTAL} = \pm 0.5\%$ , the full-scale input varies from  $(1 - 0.5/100) \times FS_{ideal}$  to  $(1 + 0.5/100) \times FS_{ideal}$ 

**Offset Error** – The offset error is the difference, given in number of LSBs, between the ADC actual average idle channel output code and the ideal average idle channel output code. This quantity is often mapped into millivolts.

**Temperature Drift** – The temperature drift coefficient (with respect to gain error and offset error) specifies the change per degree Celsius of the parameter from  $T_{MIN}$  to  $T_{MAX}$ . It is calculated by dividing the maximum deviation of the parameter across the  $T_{MIN}$  to  $T_{MAX}$  range by the difference  $T_{MAX} - T_{MIN}$ .

**Signal-to-Noise Ratio** – SNR is the ratio of the power of the fundamental  $(P_S)$  to the noise floor power  $(P_N)$ , excluding the power at dc and the first nine harmonics.

$$SNR = 10Log^{10} \frac{P_S}{P_N}$$
 (2)

SNR is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full-scale) when the power of the fundamental is extrapolated to the converter full-scale range.

**Signal-to-Noise and Distortion (SINAD)** – SINAD is the ratio of the power of the fundamental ( $P_S$ ) to the power of all the other spectral components including noise ( $P_N$ ) and distortion ( $P_D$ ), but excluding dc.

$$SINAD = 10Log^{10} \frac{P_S}{P_N + P_D}$$
(3)

SINAD is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full-scale) when the power of the fundamental is extrapolated to the converter full-scale range.

**Effective Number of Bits (ENOB)** – ENOB is a measure of the converter performance as compared to the theoretical limit based on quantization noise.

$$ENOB = \frac{SINAD - 1.76}{6.02} \tag{4}$$

**Total Harmonic Distortion (THD)** – THD is the ratio of the power of the fundamental ( $P_S$ ) to the power of the first nine harmonics ( $P_D$ ).

$$THD = 10Log^{10} \frac{P_S}{P_N}$$
 (5)

THD is typically given in units of dBc (dB to carrier).

**Spurious-Free Dynamic Range (SFDR)** – The ratio of the power of the fundamental to the highest other spectral component (either spur or harmonic). SFDR is typically given in units of dBc (dB to carrier).

**Two-Tone Intermodulation Distortion** – IMD3 is the ratio of the power of the fundamental (at frequencies  $f_1$  and  $f_2$ ) to the power of the worst spectral component at either frequency  $2f_1 - f_2$  or  $2f_2 - f_1$ . IMD3 is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full-scale) when the power of the fundamental is extrapolated to the converter full-scale range.

**DC Power-Supply Rejection Ratio (DC PSRR)** – DC PSSR is the ratio of the change in offset error to a change in analog supply voltage. The dc PSRR is typically given in units of mV/V.

**AC Power-Supply Rejection Ratio (AC PSRR)** – AC PSRR is the measure of rejection of variations in the supply voltage by the ADC. If  $\Delta V_{SUP}$  is the change in supply voltage and  $\Delta V_{OUT}$  is the resultant change of the ADC output code (referred to the input), then:

PSRR = 
$$20 \text{Log}^{10} \frac{\Delta V_{\text{OUT}}}{\Delta V_{\text{SUP}}}$$
 (Expressed in dBc) (6)

**Voltage Overload Recovery** – The number of clock cycles taken to recover to less than 1% error after an overload on the analog inputs. This is tested by separately applying a sine wave signal with 6dB positive and negative overload. The deviation of the first few samples after the overload (from the expected values) is noted.

**Common-Mode Rejection Ratio (CMRR)** – CMRR is the measure of rejection of variation in the analog input common-mode by the ADC. If  $\Delta V_{CM\_IN}$  is the change in the common-mode voltage of the input pins and  $\Delta V_{OUT}$  is the resulting change of the ADC output code (referred to the input), then:

CMRR = 
$$20\text{Log}^{10} \frac{\Delta V_{\text{OUT}}}{\Delta V_{\text{CM}}}$$
 (Expressed in dBc) (7)

Crosstalk (only for multi-channel ADCs) – This is a measure of the internal coupling of a signal from an adjacent channel into the channel of interest. It is specified separately for coupling from the immediate neighboring channel (near-channel) and for coupling from channel across the package (far-channel). It is usually measured by applying a full-scale signal in the adjacent channel. Crosstalk is the ratio of the power of the coupling signal (as measured at the output of the channel of interest) to the power of the signal applied at the adjacent channel input. It is typically expressed in dBc.

# **REVISION HISTORY**

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Cł | nanges from Revision C (August 2010) to Revision D   | Page |
|----|--|------|
|    | Changed documet status to production data  | 1    |
| •  | Updated status of ADS58B19 to production data throughout document  |      |
| •  | Updated document format to current standards   | 1    |
| •  | Changed Clock Input, Input clock sample rate parameters for both ADS58B18 and ADS58B19 in Recommended Operating Conditions table   | 3    |
|    | Added footnote 3 to Recommended Operating Conditions table   |      |
|    | Changed conditions of <i>ADC latency</i> parameter in Timing Requirements table  |      |
|    | Deleted footnote 7 from Timing Requirements table  |      |
|    | Deleted footnote 10 in Timing Requirements tableα  |      |
| •  | Deleted table 2 (CMOS Timing Across Sampling Frequencies, withe respect to output clock) and table 4 (CMOS Timing Across Sampling Frequencies, withe respect to input clock) |      |
| •  | Changed titles of Table 2 and Table 3  | 17   |
| •  | Updated Figure 8   | 18   |
| •  | Changed description of logic high in Table 6   | 20   |
| •  | Updated bit D3 of registers 25 and 42 and added register DF to Table 8   | 23   |
| •  | Changed bit 3 and description of bits 2 to 0 in Register Address 25h   | 25   |
| •  | Changed description of bit 4 in Register Address 3Dh   | 26   |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-leads (QFN) package configuration.
  - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - F. Falls within JEDEC MO-220.

# RGZ (S-PVQFN-N48)

# PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No—Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

# RGZ (S-PVQFN-N48)

# PLASTIC QUAD FLATPACK NO-LEAD

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Publication IPC-7351 is recommended for alternate designs.
- D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat—Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <a href="https://www.ti.com">https://www.ti.com</a>.
- E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
- F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
