Over-Voltage and Over-Current Charger Front-end Protection IC With Integrated Charging FET

Check for Samples: bq24350 bq24352

FEATURES

- Robust Protection
  - Input Over-Voltage Protection
  - Input Over-Current Protection
  - Accurate Battery Over-Voltage Protection
  - Thermal Shutdown
  - Output Short-Circuit Protection
- Integrated Charging FET
- LDO Mode Operation
- Current Limited Power Supply for Host Controller
- Soft-Start to Prevent Inrush Currents
- Soft-Stop to Prevent Voltage Spikes
- 30V Maximum Input Voltage
- Supports Up to 1A Load Current
- Small 2mm × 2mm 8pin SON Package

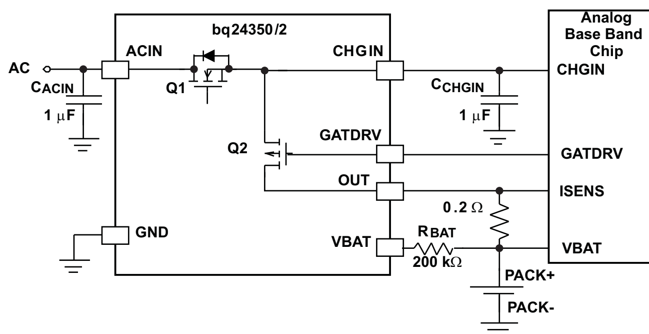
APPLICATIONS

- Mobile Phones
- Low-Power Handheld Devices

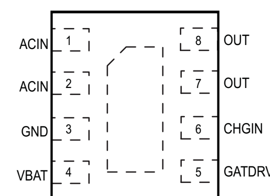
DESCRIPTION

The bq24350/2 is a highly integrated circuit designed to provide protection to Li-ion batteries from failures of the charging circuit. The IC continuously monitors the input voltage and the battery voltage. In case of an input over-voltage condition, the IC will turn off the internal power FET after a blanking time. If the battery voltage rises to unsafe levels during charging process, power is removed from the system. If the input current exceeds the over current threshold for a limited time, the IC will turn off the output power. The integrated charging FET can regulate the charge voltage and current according to the control from the host. The device can also provide a voltage source with over voltage and over current protection for host controller.

TYPICAL APPLICATION CIRCUIT



PIN ASSIGNMENT



Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

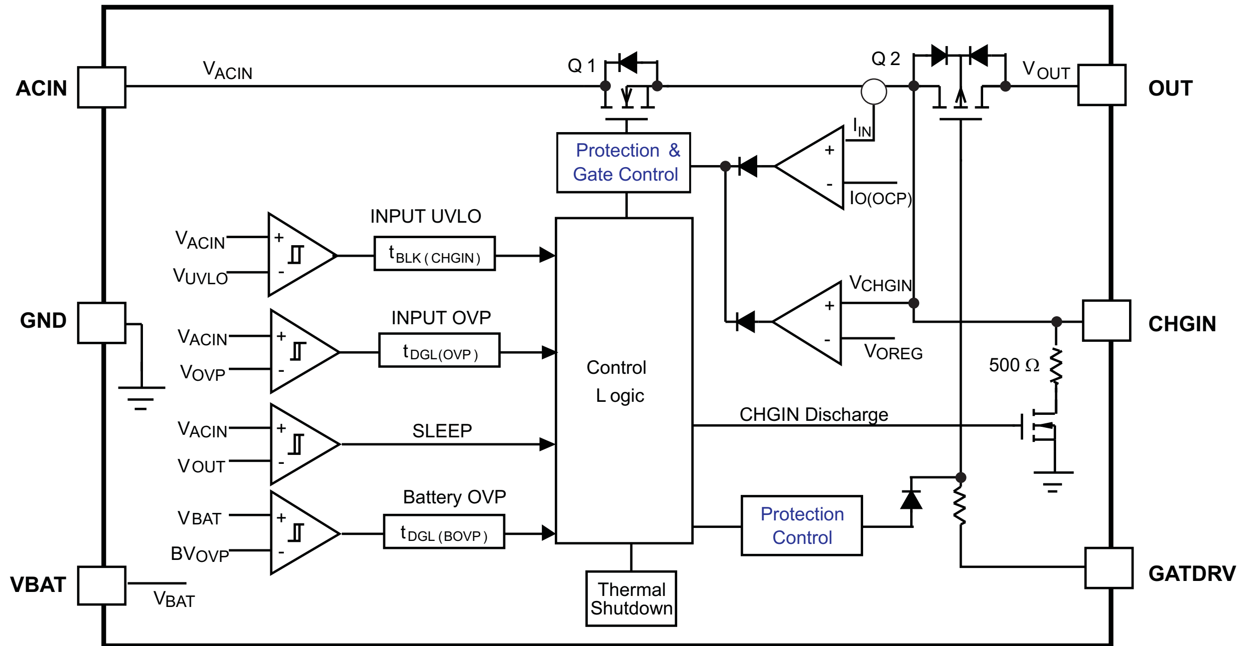
These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

SIMPLIFIED FUNCTION BLOCK DIAGRAM



PIN FUNCTIONS

PIN			
NAME	NUMBER	I/O	DESCRIPTION
ACIN	1,2	I	Power Supply Input, connect to an external DC supply. Connect an external 1µF ceramic capacitor (minimum) to GND.
OUT	7,8	O	Output terminal to the charging system.
VBAT	4	I	Battery voltage sense input. Connected to pack positive terminal through a resistor. Connected to ground if battery OVP function is not used.
GATDRV	5	I	P-FET gate drive input , connected to gate drive pin of the host charger controller
CHGIN	6	O	Output power pin for power input of host charger controller. Connect an external ceramic bypass capacitor (1.0µF minimum) to GND.
GND	3	–	Ground terminal
Thermal PAD			There is an internal electrical connection between the exposed thermal pad and the GND pin of the device. The thermal pad must be connected to the same potential as the GND pin on the printed circuit board. Do not use the thermal pad as the primary ground input for the device. GND pin must be connected to ground at all times.

ABSOLUTE MAXIMUM RATINGS[1]

over operating free-air temperature range (unless otherwise noted)

		VALUE / UNIT
Input voltage	ACIN (with respect to GND)	–0.3 V to 30 V
Output voltage	OUT, CHGIN (with respect to GND)	–0.3 V to 7V
Input voltage	VBAT, GATDRV (with respect to GND)	–0.3 V to 7 V
Input current	ACIN	–1.8 A[2] to 1.4 A
Junction temperature, T_J		–40°C to 150°C
Storage temperature, T_{STG}		–65°C to 150°C

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to the network ground terminal unless otherwise noted.
(2) Reverse current is specified for a maximum of 50 hours at $T_J < 150°C$.

BACKGROUND

During the charging process for portable devices, input voltage spikes usually happen when the AC/DC adaptor is plugged in, or charge current is cut off quickly under fault conditions, such as input OVP, OCP or battery OVP and so on. The over voltage stress may damage the analog baseband chip which has lower voltage rating due to its increased complexity. Therefore, over voltage protection is needed for the safe operation of portable devices. Another challenge arises from the charge circuit that uses external charging FET in series with a reverse blocking diode as the charging device. The battery may not be fully charged when input voltage is low due to the additional diode voltage drop. bq24350/2 will provide the solution for above problems since it has input OVP, OCP, battery OVP function, together with integrated charging FET which will eliminate the reverse blocking diode in the previously mentioned charge circuit, as shown in Figure 1.

DETAILED FUNCTIONAL DESCRIPTION

The bq24350/2 is a highly integrated circuit designed to provide protection to Li-ion batteries from failures of the charging circuit. The IC continuously monitors the input voltage and the battery voltage. In case of an input over-voltage condition, the IC will turn off the internal power FET after a blanking time. If the battery voltage rises to unsafe levels during charging process, power is removed from the system. If the input current exceeds the over current threshold for a limited time, the IC will turn off the output power. The integrated charging FET can regulate the charge voltage and current according to the control from the host. The device can also provide a voltage source with over voltage and over current protection for host controller.

Copyright © 2009, Texas Instruments Incorporated

POWER DOWN

The device remains in power down mode when the input voltage at the ACIN pin is below the under-voltage threshold V_{UVLO}. The FET Q1 and Q2 connected between ACIN and OUT pins are off.

POWER-ON RESET

The device resets when the input voltage at the ACIN pin exceeds the UVLO threshold. All internal counters and other circuit blocks are reset. The IC then waits for duration $t_{BLK(CHGIN)}$ for the input voltage to stabilize. If, after $t_{BLK(CHGIN)}$, the input voltage and battery voltage are in normal range, FET Q1 is turned ON. The IC has a soft-start feature to control the inrush current. The soft-start minimizes the ringing at the input, where the ringing occurs because the parasitic inductance of the adapter cable and the input bypass capacitor form a resonant circuit. Once the soft-start sequence starts, the IC monitors the load current. If the load current is larger than $I_{O(OCP)}$ for more than $t_{DGL(OCP)}$, FET Q1 and Q2 are switched off. The IC then repeats the power-on sequence after $t_{REC(OCP)}$.

When a short-circuit is detected at power-on and Q1 is switched off, to prevent the input voltage from spiking up due to resonance between the inductance of the input cable and the input capacitor, Q1 is turned off slowly by reducing its gate-drive gradually, resulting in a “soft-stop”.

SLEEP MODE

When ACIN falls to below sleep mode entry threshold (V_{SENTRY}), the device operates in sleep mode and turns off Q1 and Q2 by internal circuit regardless of the gate drive signal from GARDRV pin. The device exits sleep mode when ACIN rising to above sleep mode exit threshold (V_{SEXIT}). In this way, the device behaves like a diode and no external reverse blocking diode is needed in the application circuit.

OPERATING

The device continuously monitors the input voltage, the input current and the battery voltage as described in detail below:

Input Over-Voltage Protection and LDO Mode Operation

The CHGIN output of the IC operates similar to a linear regulator. Figure 13 shows the typical input OVP performance. When the ACIN input voltage is less than $V_{O(REG)}$, and above the V_{UVLO}, the CHGIN output voltage tracks the input voltage with a voltage drop caused by RDS(on) of the protection FET Q1. When the ACIN input voltage is greater than $V_{O(REG)}$ plus the RDS(on) drop of Q1, and less than V_{OVP}, the CHGIN output voltage is regulated to $V_{O(REG)}$, and this is also referred as LDO mode operation. If the input voltage rises above V_{OVP}, the internal FET Q1 and Q2 are turned off after a blanking time of $t_{DGL(OVP)}$, removing power from the circuit. When the input voltage drops below V_{OVP} – $V_{HYS-OVP}$, and is still above V_{UVLO}, the FET Q1 and Q2 are turned on again after a deglitch time of $t_{REC(OVP)}$, which ensures that the input supply is stabilized when the IC starts up again.

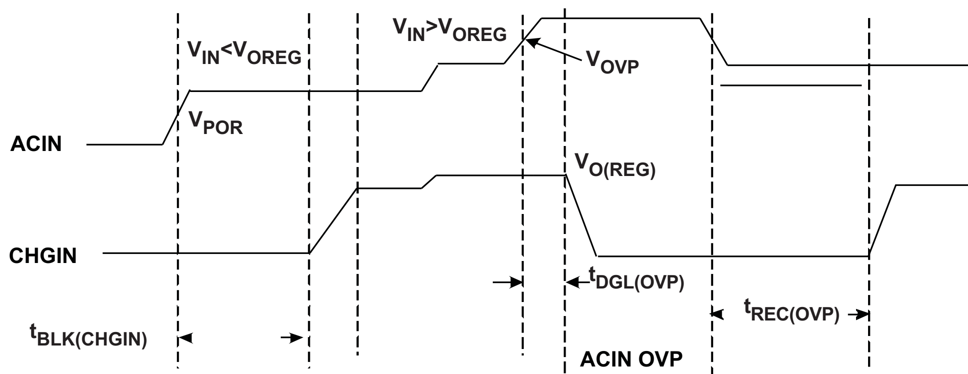

Figure 13. Input OVP Timing Diagram

Over Current Limiting and Protection

The device includes a low drop out linear current regulator. This current regulator uses Q1 as the controlling

Copyright © 2009, Texas Instruments Incorporated

power device. Once the soft start sequence starts, the input current is limited to the Over Current Protection (OCP) threshold, $I_{O(OCP)}$. If the input current through the IC attempts to exceed the OCP threshold, the switch Q1 is opened only enough to maintain the current at the OCP level. If the current limiting condition is maintained longer than the deglitch time, $t_{DGL(OCP)}$, both the switch Q1 and Q2 are opened completely, as shown in Figure 14. In this fault case, the switch Q1 is turned off slowly, typically taking 100μS.

Once the OCP feature has been activated, the switch Q1 and Q2 will remain off for the OCP recovery time, $t_{REC(OCP)}$. Following this time the switch will turn on, using soft start sequence. If the current through the IC remains below the OCP threshold, the switch will remain closed and normal operation resumes. If the current through the IC attempts to exceed the OCP threshold again, the operation described above repeats.

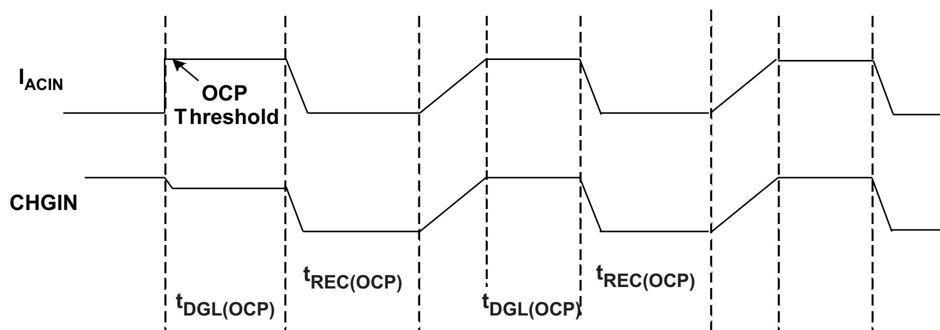

Figure 14. Charge Current OCP Timing Diagram

Battery Over-Voltage Protection

The battery over-voltage threshold, BV_{OVP}, is internally set to 4.35V. If the battery voltage exceeds the BV_{OVP} threshold, the FET Q1 and Q2 are turned off after a deglitch time of $t_{DGL(BOVP)}$. The FET is turned on once the battery voltage drops to BV_{OVP} – $V_{HYS\text{-}BOVP}$ and remains below this threshold for $t_{REC(BOVP)}$, as shown in Figure 15. In this battery over-voltage fault case, Q1 is switched OFF gradually for a smooth transient response.

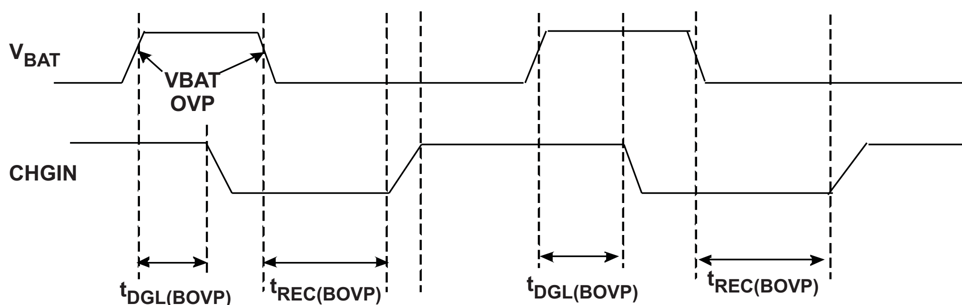

Figure 15. Battery OVP Timing Diagram

Thermal Protection

If the junction temperature of the device exceeds $T_{J(OFF)}$, the FET Q1 and Q2 are turned off. The FET is turned back on when the junction temperature falls below $T_{J(OFF)}$ – $T_{J(OFF\text{-}HYS)}$.

APPLICATION INFORMATION

Selection of R_{BAT}

It is strongly recommended that the battery not be tied directly to the VBAT pin of the device, as under some failure modes of the IC, the voltage at the ACIN pin may appear on the VBAT pin. This voltage can be as high as 30V, and applying 30V to the battery in case of the failure of the device can be hazardous. Connecting the VBAT pin through R_{BAT} prevents a large current from flowing into the battery in case of failure of the IC. In the interests of safety, R_{BAT} should have a very high value. The problem with a large R_{BAT} is that the voltage drop across this resistor because of the VBAT bias current IVBAT causes an error in the BV_{OVP} threshold. This error is over and above the tolerance on the nominal 4.35V BV_{OVP} threshold.

Choosing R_{BAT} in the range 100kΩ to 470kΩ is a good compromise. In the case of IC failure, with R_{BAT} equal to 100kΩ, the maximum current flowing into the battery would be (30V – 3V) ÷ 100kΩ = 270µA, which is low enough to be absorbed by the bias currents of the system components. R_{BAT} equal to 100kΩ would result in a worst-case voltage drop of $R_{BAT} \times I_{VBAT}$ 1mV. This is negligible compared to the internal tolerance of 50mV on the BV_{OVP} threshold.

If the Battery OVP function is not required, the VBAT pin should be connected to GND.

Selection of Input and Output Bypass Capacitors

The input capacitor C_{ACIN} is for decoupling, and serves an important purpose. Whenever there is a step change downwards in the system load current, the inductance of the input cable causes the input voltage to spike up. C_{ACIN} prevents the input voltage from overshooting to dangerous levels. It is strongly recommended that a ceramic capacitor of at least 1µF be used at the input of the device. It should be located in close proximity to the ACIN pin.

C_{CHGIN} should also be a ceramic capacitor of at least 1µF, located close to the CHGIN pin. C_{CHGIN} also serves as the input decoupling capacitor for the charging circuit downstream of the protection IC.

PCB Layout Guidelines

1. This device is a protection device, and is meant to protect down-stream circuitry from hazardous voltages. Potentially, high voltages may be applied to this IC. It has to be ensured that the edge-to-edge clearances of PCB traces satisfy the design rules for the maximum voltages expected to be seen in the system.
2. The device uses SON packages with a PowerPAD ™ . For good thermal performance, the PowerPAD should be thermally coupled with the PCB ground plane. In most applications, this will require a copper pad directly under the IC. This copper pad should be connected to the ground plane with an array of thermal vias.
3. C_{ACIN} and C_{CHGIN} should be located close to the IC. Other components like R_{BAT} should also be located close to the IC.

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

[3] MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[4] Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
