

PROGRAMMABLE 3-PLL CLOCK SYNTHESIZER / MULTIPLIER / DIVIDER

Check for Samples: [CDC706](#)

FEATURES

- High Performance 3:6 PLL Based Clock Synthesizer / Multiplier / Divider
- User Programmable PLL Frequencies
- Easy In-Circuit Programming via SMBus Data Interface
- Wide PLL Divider Ratio Allows 0-PPM Output Clock Error
- Clock Inputs Accept a Crystal or a Single-Ended LVCMOS or a Differential Input Signal
- Accepts Crystal Frequencies from 8 MHz up to 54 MHz
- Accepts LVCMOS or Differential Input Frequencies up to 200 MHz
- Two Programmable Control Inputs [S0/S1] for User Defined Control Signals
- Six LVCMOS Outputs with Output Frequencies up to 300 MHz
- LVCMOS Outputs can be Programmed for Complementary Signals
- Free Selectable Output Frequency via Programmable Output Switching Matrix [6x6] Including 7-Bit Post-Divider for Each Output
- PLL Loop Filter Components Integrated
- Low Period Jitter (Typical 60 ps)
- Features Spread Spectrum Clocking (SSC) for Lowering System EMI
- Programmable Output Slew-Rate Control (SRC) for Lowering System EMI
- 3.3-V Device Power Supply
- Industrial Temperature Range –40°C to 85°C
- Development and Programming Kit for Easy PLL Design and Programming (TI Pro-Clock™)

- Packaged in 20-Pin TSSOP
- Factory Programmable for Customized Default Settings are Available. Contact TI Sales for More Details.

APPLICATIONS

- Wireless Base Stations
- Network Line Cards
- Datacom / Telecom

TERMINAL ASSIGNMENT

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Pro-Clock is a trademark of Texas Instruments.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

DESCRIPTION

The CDC706 is one of the smallest and powerful PLL synthesizer / multiplier / divider available today. Despite its small physical outlines, the CDC706 is very flexible. It has the capability to produce an almost independent output frequency from a given input frequency.

The input frequency can be derived from a LVCMOS, differential input clock, or a single crystal. The appropriate input waveform can be selected via the SMBus data interface controller.

To achieve an independent output frequency the reference divider M and the feedback divider N for each PLL can be set to values from 1 up to 511 for the M-Divider and from 1 up to 4095 for the N-Divider. The PLL-VCO (voltage controlled oscillator) frequency then is routed to the free programmable output switching matrix to any of the six outputs. The switching matrix includes an additional 7-bit post-divider (1-to-127) and an inverting logic for each output.

The deep M/N divider ratio allows the generation of zero ppm clocks from any reference input frequency (e.g., a 27-MHz).

The CDC706 includes three PLLs of those one supports SSC (spread-spectrum clocking). PLL1, PLL2, and PLL3 are designed for frequencies up to 300 MHz and optimized for zero-ppm applications with wide divider factors.

PLL2 also supports center-spread and down-spread spectrum clocking (SSC). This is a common technique to reduce electro-magnetic interference. Also, the slew-rate controllable (SRC) output edges minimize EMI noise.

Based on the PLL frequency and the divider settings, the internal loop filter components will be automatically adjusted to achieve high stability and optimized jitter transfer characteristic of the PLL.

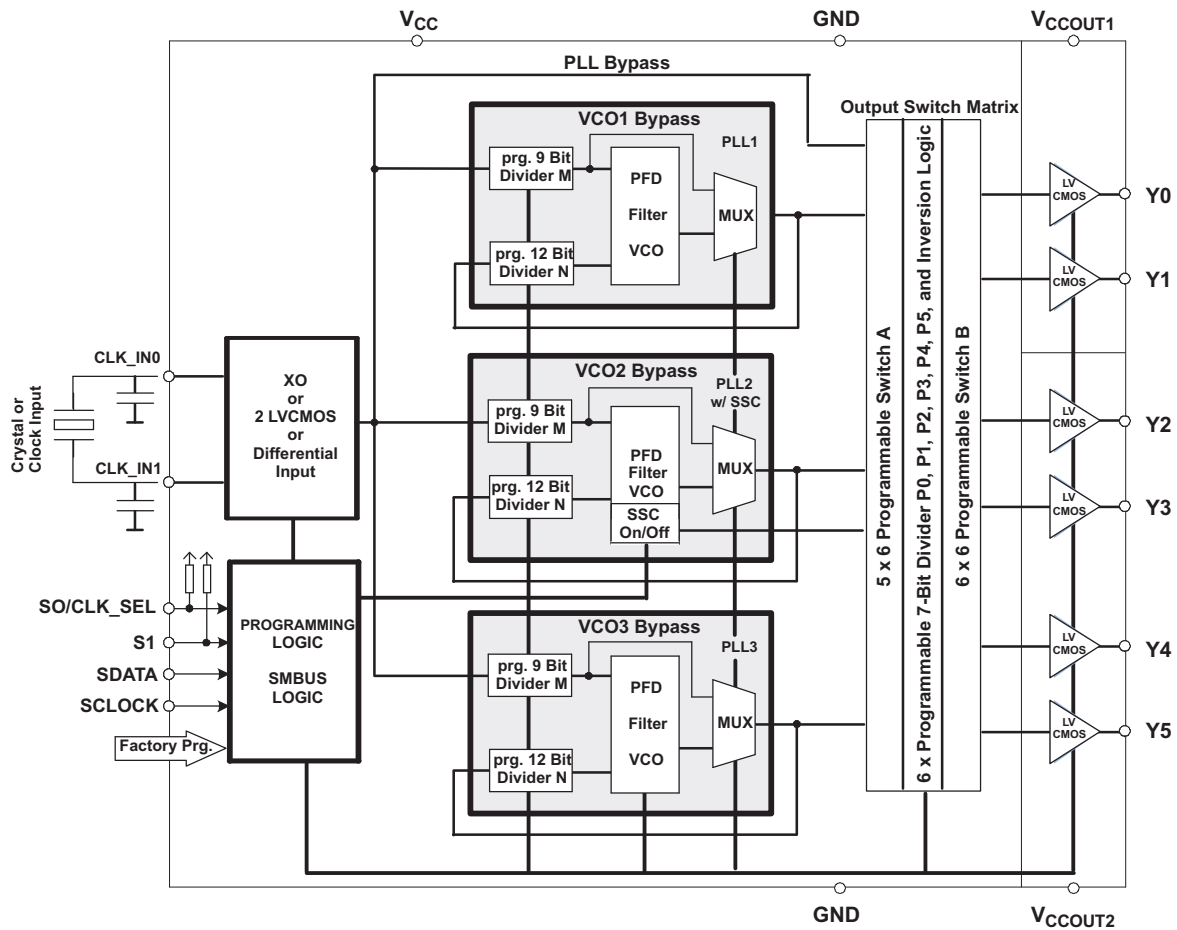

The device provides customized applications. It is preprogrammed with a factory default configuration (see [Figure 13](#)) and can be reprogrammed to a different application configuration via the serial SMBus Interface.

Two free programmable inputs, S0 and S1, can be used to control for each application the most demanding logic control settings (outputs disable to low, outputs 3-state, power down, PLL bypass, etc).

The CDC706 has three power supply pins, V_{CC} , V_{CCOUT1} , and V_{CCOUT2} . V_{CC} is the power supply for the device. It operates from a single 3.3-V supply voltage. V_{CCOUT1} and V_{CCOUT2} are the power supply pins for the outputs. V_{CCOUT1} supplies the outputs Y0 and Y1 and V_{CCOUT2} supplies the outputs Y2, Y3, Y4, and Y5. Both outputs supplies can be 2.3 V to 3.6 V. At output voltages lower than 3.3 V, the output current drive is limited.

The CDC706 is characterized for operation from -40°C to 85°C .

OUTPUT SWITCH MATRIX

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	TSSOP20 NO.		
Y0 to Y5	11, 12, 15, 16, 19, 20	O	LVC MOS outputs
CLK_IN0	5	I	Dependent on SMBus settings, CLK_IN0 is the crystal oscillator input and can also be used as LVC MOS input or as positive differential signal inputs.
CLK_IN1	6	I/O	Dependent on SMBus settings, CLK_IN1 is serving as the crystal oscillator output or can be the second LVC MOS input or the negative differential signal input.
V _{CC}	3, 7	Power	3.3-V power supply for the device.
V _{CCOUT1}	14	Power	Power supply for outputs Y0, Y1.
V _{CCOUT2}	18	Power	Power supply for outputs Y2, Y3, Y4, Y5.
GND	4, 8, 13, 17	Ground	Ground
S0, CLK_SEL	1	I	User programmable control input S0 (PLL bypass or power-down mode) , or CLK_SEL (selects one of two LVC MOS clock inputs), dependent on the SMBus settings; LVC MOS inputs; internal pullup 150 kΩ.
S1	2	I	User programmable control input S1 (output enable/disable or all output low), dependent on the SMBus settings; LVC MOS inputs; internal pullup 150 kΩ
SDATA	9	I/O	Serial control data input/output for SMBus controller; LVC MOS input
SCLOCK	10	I	Serial control clock input for SMBus controller; LVC MOS input

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	VALUE	UNIT
V _{CC} Supply voltage range	–0.5 to 4.6	V
V _I Input voltage range ⁽²⁾	–0.5 to V _{CC} + 0.5	V
V _O Output voltage range ⁽²⁾	–0.5 to V _{CC} + 0.5	V
I _I Input current (V _I < 0, V _I > V _{CC})	±20	mA
I _O Continuous output current	±50	mA
T _{stg} Storage temperature range	–65 to 150	°C
T _J Maximum junction temperature	125	°C

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
- (2) The input and output negative voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

PACKAGE THERMAL RESISTANCE

for TSSOP20 (PW) Package^{(1) (2)}

PARAMETER		AIRFLOW (LFM)	°C/W
θ _{JA} Thermal resistance junction-to-ambient		0	66.3
		150	59.3
		250	56.3
		500	51.9
θ _{JC} Thermal resistance junction-to-case			19.7

- (1) The package thermal impedance is calculated in accordance with JESD 51 and JEDEC2S2P (high-k board).
- (2) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI Web site at www.ti.com.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	Device supply voltage	3	3.3	3.6	V
V_{CCOUT1}	Output Y0, Y1 supply voltage	2.3		3.6	V
V_{CCOUT2}	Output Y2, Y3, Y4, Y5 supply voltage	2.3		3.6	V
V_{IL}	Low level input voltage LVCMOS			$0.3 V_{CC}$	V
V_{IH}	High level input voltage LVCMOS	$0.7 V_{CC}$			V
$V_{Ithresh}$	Input voltage threshold LVCMOS		$0.5 V_{CC}$		V
V_I	Input voltage range LVCMOS	0		3.6	V
$ V_{ID} $	Differential input voltage	0.1			V
V_{IC}	Common-mode for differential input voltage	0.2		$V_{CC} - 0.6$	V
I_{OH}/I_{OL}	Output current (3.3 V)			± 6	mA
I_{OH}/I_{OL}	Output current (2.5 V)			± 4	mA
C_L	Output load LVCMOS			25	pF
T_A	Operating free-air temperature	-40		85	°C

RECOMMENDED CRYSTAL SPECIFICATIONS

		MIN	NOM	MAX	UNIT
f_{Xtal}	Crystal input frequency range (fundamental mode)	8	27	54	MHz
ESR	Effective series resistance ⁽¹⁾ ⁽²⁾	15		60	Ω
C_{IN}	Input capacitance CLK_IN0 and CLK_IN1		3		pF

 (1) For crystal frequencies above 50 MHz the effective series resistor should not exceed 50 Ω to assure stable start-up condition.

 (2) Maximum Power Handling (Drive Level) see [Figure 15](#) .

TIMING REQUIREMENTS

over recommended ranges of supply voltage, load, and operating-free air temperature

		MIN	NOM	MAX	UNIT
CLK_IN REQUIREMENTS					
f_{CLK_IN}	CLK_IN clock input frequency (LVCMOS or Differential)	PLL mode	1	200	MHz
		PLL bypass mode	0	200	
t_r / t_f	Rise and fall time CLK_IN signal (20% to 80%)			4	ns
duty _{REF}	Duty cycle CLK_IN at $V_{CC} / 2$	40%		60%	
SMBus TIMING REQUIREMENTS (see Figure 11)					
f_{SCLK}	SCLK frequency			100	kHz
$t_{h(START)}$	START hold time	4			μ s
$t_w(SCLL)$	SCLK low-pulse duration	4.7			μ s
$t_w(SCLH)$	SCLK high-pulse duration	4		50	μ s
$t_{su(START)}$	START setup time	0.6			μ s
$t_{h(SDATA)}$	SDATA hold time	0.3			μ s
$t_{su(SDATA)}$	SDATA setup time	0.25			μ s
t_r	SCLK / SDATA input rise time			1000	ns
t_f	SCLK / SDATA input fall time			300	ns
$t_{su(STOP)}$	STOP setup time	4			μ s
t_{BUS}	Bus free time	4.7			μ s
t_{POR}	Time in which the device must be operational after power-on reset			500	ms

DEVICE CHARACTERISTICS

over recommended operating free-air temperature range and test load (unless otherwise noted), see [Figure 1](#)

PARAMETER		TEST CONDITIONS	MIN	TYP (1)	MAX	UNIT	
OVERALL PARAMETER							
I_{CC}	Supply current ⁽²⁾	All PLLs on, all outputs on, $f_{OUT} = 80$ MHz, $f_{CLK_IN} = 27$ MHz, $f_{(VCO)} = 160$ MHz		90	115	mA	
I_{CCPD}	Power down current. Every circuit powered down except SMBus	$f_{IN} = 0$ MHz, $V_{CC} = 3.6$ V		50		μ A	
$V_{(PUC)}$	Supply voltage V_{CC} threshold for power up control circuit			2.1		V	
$f_{(VCO)}$	VCO frequency of internal PLL (any of three PLLs)	Normal speed-mode ⁽³⁾	All PLLs	80	200	MHz	
			PLL2 with SSC	80	167		
		High-speed mode ⁽³⁾		180	300		
f_{OUT}	LVCMOS output frequency range ⁽⁴⁾ , See Figure 4	$V_{CC} = 2.5$ V			250	MHz	
		$V_{CC} = 3.3$ V			300		
LVCMOS PARAMETER							
$V_{(IK)}$	LVCMOS input voltage	$V_{CC} = 3$ V, $I_I = -18$ mA			-1.2	V	
I_I	LVCMOS input current (CLK_IN0 and CLK_IN1)	$V_I = 0$ V or V_{CC} , $V_{CC} = 3.6$ V			± 5	μ A	
I_{IH}	LVCMOS input current (S1/S0)	$V_I = V_{CC}$, $V_{CC} = 3.6$ V			5	μ A	
I_{IL}	LVCMOS input current (S1/S0)	$V_I = 0$ V, $V_{CC} = 3.6$ V	-35		-10	μ A	
C_I	Input capacitance at CLK_IN0 and CLK_IN1	$V_I = 0$ V or V_{CC}		3		pF	
LVCMOS PARAMETER FOR $V_{CCOUT} = 3.3$-V Mode							
V_{OH}	LVCMOS high-level output voltage	$V_{CCOUT} = 3$ V, $I_{OH} = -0.1$ mA		2.9		V	
		$V_{CCOUT} = 3$ V, $I_{OH} = -4$ mA		2.4			
		$V_{CCOUT} = 3$ V, $I_{OH} = -6$ mA		2.1			
V_{OL}	LVCMOS low-level output voltage	$V_{CCOUT} = 3$ V, $I_{OL} = 0.1$ mA			0.1	V	
		$V_{CCOUT} = 3$ V, $I_{OL} = 4$ mA			0.5		
		$V_{CCOUT} = 3$ V, $I_{OL} = 6$ mA			0.85		
t_{PLH} , t_{PHL}	Propagation delay	All PLL bypass		9		ns	
		VCO bypass		11			
t_{r0}/t_{f0}	Rise and fall time for output slew rate 0	$V_{CCOUT} = 3.3$ V (20%–80%)	1.7	3.3	4.8	ns	
t_{r1}/t_{f1}	Rise and fall time for output slew rate 1	$V_{CCOUT} = 3.3$ V (20%–80%)	1.5	2.5	3.2	ns	
t_{r2}/t_{f2}	Rise and fall time for output slew rate 2	$V_{CCOUT} = 3.3$ V (20%–80%)	1.2	1.6	2.1	ns	
t_{r3}/t_{f3}	Rise and fall time for output slew rate 3 (default configuration)	$V_{CCOUT} = 3.3$ V (20%–80%)	0.4	0.6	1	ns	
$t_{jit(cc)}$	Cycle-to-cycle jitter ⁽⁵⁾ ⁽⁶⁾	1 PLL, 1 Output	$f_{OUT} = 50$ MHz		55	90	ps
			$f_{OUT} = 245.76$ MHz		45	80	
		3 PLLs, 3 Outputs	$f_{OUT} = 50$ MHz		125	155	
			$f_{OUT} = 245.76$ MHz		60	95	

- (1) All typical values are at respective nominal V_{CC} .
- (2) For calculating total supply current, add the current from [Figure 2](#), [Figure 3](#), and [Figure 4](#). Using high-speed mode of the VCO reduces the current consumption. See [Figure 3](#).
- (3) Normal-speed mode or high-speed mode must be selected by the VCO frequency selection bit in Byte 6, Bit [7:5]. The min $f_{(VCO)}$ can be lower but impacts jitter-performance.
- (4) Do not exceed the maximum power dissipation of the 20-pin TSSOP package (600 mW at no air flow). See [Figure 5](#)
- (5) 50000 cycles.
- (6) Jitter depends on configuration. Jitter data is normal t_r/t_f , input frequency = 3.84 MHz, $f_{(VCO)} = 245.76$ MHz.

DEVICE CHARACTERISTICS (continued)

 over recommended operating free-air temperature range and test load (unless otherwise noted), see [Figure 1](#)

PARAMETER		TEST CONDITIONS	MIN	TYP (1)	MAX	UNIT
$t_{jit(per)}$	Peak-to-peak period jitter ⁽⁷⁾ ⁽⁸⁾	1 PLL, 1 Output	$f_{OUT} = 50$ MHz	60	90	ps
			$f_{OUT} = 245.76$ MHz	55	80

APPLICATION INFORMATION

SMBus Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. It follows the SMBus specification Version 2.0, which is based upon the principals of operation of I²C. More details of the SMBus specification can be found at <http://www.smbus.org>.

Through the SMBus, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers associated with the SMBus data interface initialize to their default setting upon power-up; therefore, using this interface is optional. The clock device register changes are normally made upon system initialization, if any are required.

Data Protocol

The clock driver serial protocol accepts Byte Write, Byte Read, Block Write, and Block Read operations from the controller.

For Block Write/Read operations, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For Byte Write and Byte Read operations, the system controller can access individually addressed bytes.

Once a byte has been sent, it is written into the internal register and effective immediately with the rising edge of the ACK bit. This applies to each transferred byte, independent of whether this is a Byte Write or a Block Write sequence.

The offset of the indexed byte is encoded in the command code, as described in [Table 1](#).

The Block Write and Block Read protocol is outlined in [Figure 9](#) and [Figure 10](#), while [Figure 7](#) and [Figure 8](#) outlines the corresponding Byte Write and Byte Read protocol.

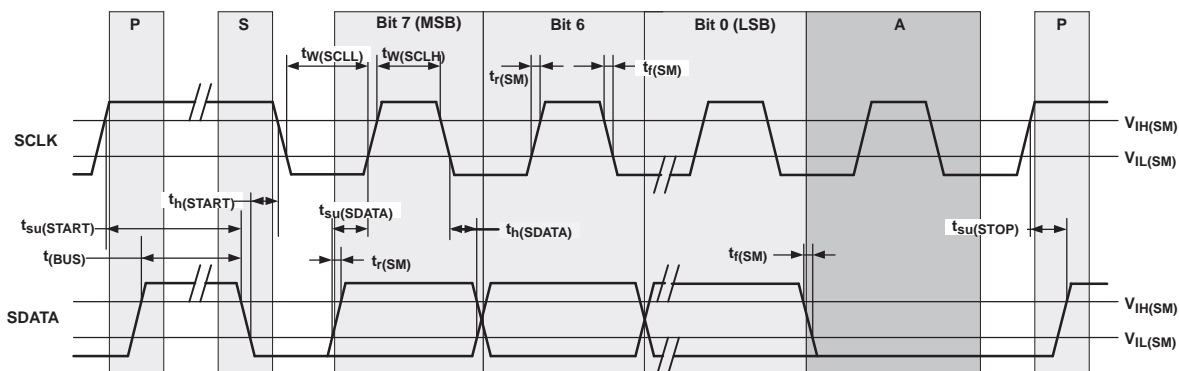

Figure 11. Timing Diagram Serial Control Interface

SMBus Hardware Interface

The following diagram shows how the CDC706 clock synthesizer is connected to the SMBus. Note that the current through the pullup resistors (R_p) must meet the SMBus specifications (min 100 μ A, max 350 μ A). If the CDC706 is not connected to SMBus, the SDATA and SCLK inputs have to be connected with 10 k Ω resistors to V_{CC} to avoid floating input conditions.

Byte 23	Reserved	Y4 Inv. or Non-Inv	Y4 Slew-Rate Control		Y4 Enable or Low	Y4 Divider Selection (Switch B)		
Byte 24	Reserved	Y5 Inv or Non-Inv	Y5 Slew-Rate Control		Y5 Enable or Low	Y5 Divider Selection (Switch B)		
Byte 25	Reserved	Spread Spectrum (SSC) Modulation Selection			Frequency Selection for SSC			
Byte 26	Reserved	7-Bit Byte Count						

Default Device Setting

The CDC706 is pre-programmed with a factory default configuration as shown below. This puts the device in an operating mode without the need to program it first. The default setting appears after power is switched on or after a power-down/up sequence until it is re-programmed by the user to a different application configuration. A new register setting is programmed via the serial SMBUS Interface.

A different default setting can be programmed upon customer request. Contact a Texas Instruments sales or marketing representative for more information.

NOTE: All outputs are enabled and in non-inverting mode. S0, S1, and SSC comply according the default setting described in Byte 10 and Byte 25 respectively.

Figure 13. Default Device Setting

The output frequency can be calculated:

$$f_{\text{out}} = \frac{f_{\text{in}} \times N}{M \times P}, \text{ i.e., } f_{\text{out}} = \frac{27 \text{ MHz} \times 8}{(1 \times 8)} = 27 \text{ MHz}$$

- (1) By selecting the PLL divider factors, $M \leq N$ and $80 \text{ MHz} \leq f_{vco} \leq 300 \text{ MHz}$.
- (2) Unless customer specific setting.
- (3) Default setting of divider N for PLL1 = 8, for PLL2 = 250 and for PLL3 = 3136.

Byte 3 Bit [7:5]: PLL (VCO) Bypass Multiplexer		
PLLxMUX	PLL (VCO) MUX Output	Default ⁽¹⁾
0	PLLx	Yes
1	VCO bypass	

(1) Unless customer specific setting.

Byte 6 Bit [7:5]: VCO Frequency Selection Mode for each PLL ⁽¹⁾		
PLLxFVCO	VCO Frequency Range	Default ⁽²⁾
0	80-200 MHz	
1	180-300 MHz	Yes

(1) This bit selects the normal-speed mode or the high-speed mode for the dedicated VCO in PLL1, PLL2 or PLL3. At power-up, the high-speed mode is selected, f_{VCO} is 180-300 MHz. In case of higher f_{VCO} , this bit has to be set to [1].

(2) Unless customer specific setting.

Byte 9 to 12: Outputs Switch Matrix (5x6 Switch A) PLL Selection for P-Divider P0-P5				
SWAPx2	SWAPx1	SWAPx0	Any Output Px	Default ⁽¹⁾
0	0	0	PLL bypass (input clock)	
0	0	1	PLL1	P2, P3, P4, P5
0	1	0	PLL2 non-SSC	P0
0	1	1	PLL2 w/ SSC ⁽²⁾	
1	0	0	PLL3	P1
1	0	1	Reserved	
1	1	0	Reserved	
1	1	1	Reserved	

(1) Unless customer specific setting.

(2) PLL2 has a SSC output and non-SSC output. If SSC bypass is selected (see Byte 25, Bit [6:4]), the SSC circuitry of PLL2 is powered-down and the SSC output is reset to logic low. The non-SSC output of PLL2 is not affected by this mode and can still be used.

Byte 10, Bit [1:0]: Configuration Settings of Input S0/CLK_SEL			
S01	S00	Function	Default ⁽¹⁾
0	0	If S0 is low, the PLLs and the clock-input stage are going into power-down mode, outputs are in 3-state, all actual register settings will be maintained, SMBus stays active ⁽²⁾	Yes
0	1	If S0 is low, the PLL and all dividers (M-Div and P-Div) are bypassed and PLL is in power-down, all outputs are active (inv. or non-inv.), actual register settings will be maintained, SMBus stays active; this mode is useful for production test;	
1	0	CLK_SEL (input clock selection — overwrites the CLK_SEL setting in Byte 10, Bit [4]) ⁽³⁾ — CLK_SEL is set low selects CLK_IN_IN0 — CLK_SEL is set high selects CLK_IN_IN1	
1	1	Reserved	

(1) Unless customer specific setting.

(2) Power-down mode overwrites 3-state or low-state of S1 setting in Byte 10, Bit [3:2].

(3) If the clock input (CLK_IN0/CLK_IN1) is selected as crystal input or differential clock input (Byte 11, Bit [7:6]) then this setting is not relevant.

Byte 10, Bit [3:2]: Configuration Settings of Input S1			
S11	S10	Function	Default ⁽¹⁾
0	0	If S1 is set low, all outputs are switched to a low-state (non-inv.) or high-state (inv.);	Yes
0	1	If S1 is set low, all outputs are switched to a 3-state	
1	0	Reserved	
1	1	Reserved	

(1) Unless customer specific setting.

Byte 10, Bit [4]: Input Clock Selection ⁽¹⁾		
CLKSEL	Input Clock	Default ⁽²⁾
0	CLK_IN0	Yes
1	CLK_IN1	

(1) This bit is not relevant, if crystal input or differential clock input is selected, Byte 11, Bit [7:6].

(2) Unless customer specific setting.

Byte 11, Bit [7:6]: Input Signal Source ⁽¹⁾			
IS1	IS0	Function	Default ⁽²⁾
0	0	CLK_IN0 is Crystal Oscillator Input and CLK_IN1 is serving as Crystal Oscillator Output.	Yes
0	1	CLK_IN0 and CLK_IN1 are two LVCMOS Inputs. CLK_IN0 or CLK_IN1 are selectable via CLK_SEL control pin.	
1	0	CLK_IN0 and CLK_IN1 serve as differential signal inputs.	
1	1	Reserved	

- (1) In case the crystal input or differential clock input is selected, the input clock selection, Byte 10, Bit [4], is not relevant.
 (2) Unless customer specific setting.

Byte 12, Bit [6]: Power-Down Mode (except SMBus)		
PD	Power-Down Mode	Default ⁽¹⁾
0	Normal Device Operation	Yes
1	Power Down ⁽²⁾	

- (1) Unless customer specific setting.
 (2) In power down, all PLLs and the Clock-Input-Stage are going into power-down mode, all outputs are in 3-State, all actual register settings will be maintained and SMBus stays active. Power-Down Mode overwrites 3-State or Low-State of S0 and S1 setting in Byte 10.

Byte 13 to 18, Bit [6:0]: Outputs Switch Matrix - 6x7-Bit Divider P0-P5								
DIVYx6	DIVYx5	DIVYx4	DIVYx3	DIVYx2	DIVYx1	DIVYx0	Div by	Default ^{(1) (2)}

- (1) Defines the number of Bytes, which will be sent from this device at the next Block Read protocol.
- (2) Unless customer specific setting.

FUNCTIONAL DESCRIPTION

Clock Inputs (CLK_IN0 and CLK_IN1)

The CDC706 features two clock inputs which can be used as:

- Crystal oscillator input (default setting)
- Two independent single-ended LVCMOS inputs
- Differential signal input

The dedicated clock input can be selected by the *input signal source* Bit [7:6] of Byte 11.

Crystal Oscillator Inputs

The input frequency range in crystal mode is 8 MHz to 54 MHz. The CDC706 uses a Pierce-type oscillator circuitry with included feedback resistance for the inverting amplifier. The user, however, has to add external capacitors C_{X0} , C_{X1} to match the input load capacitor from the crystal (see [Figure 14](#)). The required values can be calculated:

$$C_{X0} = C_{X1} = 2 \times C_L - C_{ICB},$$

where C_L is the crystal load capacitor as specified for the crystal unit and C_{ICB} is the input capacitance of the device including the board capacitance (stray capacitance of PCB).

For example, for a fundamental 27-MHz crystal with C_L of 9 pF and C_{ICB} of 4 pF,

$$C_{X0} = C_{X1} = (2 \times 9 \text{ pF}) - 3 \text{ pF} = 15 \text{ pF}.$$

It is important to use a short PCB trace from the device to the crystal unit to keep the stray capacitance of the oscillator loop to a minimum.

Figure 14. Crystal Input Circuitry

In order to ensure a stable oscillating, a certain drive power must be applied. The CDC706 features an input oscillator with adaptive gain control which relieves the user to manually program the gain. The drive level is the amount of power dissipated by the oscillating crystal unit and is usually specified in terms of power dissipated by the resonator (equivalent series resistance (ESR)). [Figure 15](#) gives the resulting drive level vs crystal frequency and ESR.

Figure 15. Crystal Drive Power

For example, if a 27-MHz crystal with ESR of 50 Ω is used and $2 \times C_L$ is 18 pF, the drive power is 21 μW. Drive level should be held to a minimum to avoid over driving the crystal. The maximum power dissipation is specified for each type of crystal in the oscillator specifications, i.e., 100 μW for the example above.

Single-Ended LVCMOS Clock Inputs

When selecting the LVCMOS clock mode, CLK_IN0 and CLK_IN1 act as regular clock inputs pins and can be driven up to 200 MHz. Both clock inputs circuitry are equal in design and can be used independently to each other (see Figure 16). The internal clock select bit, Byte 10, Bit [4], selects one of the two input clocks. CLK_IN0 is the default selection. There is also the option to program the external control pin S0/CLK_SEL as clock select pin, Byte 10, Bit [1:0].

The two clock inputs can be used for redundancy switching, i.e. to switch between a primary clock and secondary clock. Note a phase difference between the clock inputs may require PLL correction. Also in case of different frequencies between the primary and secondary clock, the PLL has to re-lock to the new frequency.

A. CLK_SEL is optional and can be configured by SMBUS setting.

Figure 16. LVCMOS Clock Input Circuitry

Differential Clock Inputs

The CDC706 supports differential signaling as well. In this mode, CLK_IN0 and CLK_IN1 pin serve as differential signal inputs and can be driven up to 200 MHz.

The minimum magnitude of the differential input voltage is 100 mV over a differential common-mode input voltage range of 200 mV to $V_{CC} - 0.6$. If LVDS or LVPECL signal levels are applied, ac-coupling and a biasing structure is recommended to adjust the different physical layers (see Figure 17). The capacitor removes the dc component of the signal (common-mode voltage), while the ac component (voltage swing) is passed on. A resistor pull-up and/or pull-down network represents the biasing structure used to set the common-mode voltage on the receiver side of the ac-coupling capacitor. DC coupling is also possible.

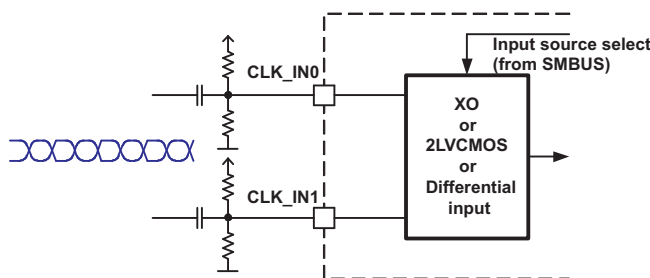

Figure 17. Differential Clock Input Circuitry

PLL Configuration and Setting

The CDC706 includes three PLLs which are equal in function and performance. Except PLL2 which in addition supports spread spectrum clocking (SSC) generation. Figure 18 shows the block diagram of the PLL.

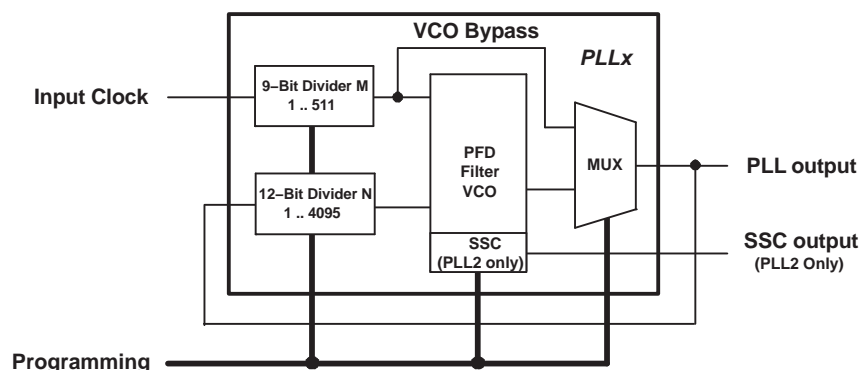

Figure 18. PLL Architecture

All three PLLs are designed for easiest configuration. The user just has to define the input and output frequencies or the divider (M, N, P) setting respectively. All other parameters, such as charge-pump current, filter components, phase margin, or loop bandwidth are controlled and set by the device itself. This assures optimized jitter attenuation and loop stability.

The PLL support normal-speed mode ($80 \text{ MHz} \leq f_{VCO} \leq 200 \text{ MHz}$) and high-speed mode ($180 \text{ MHz} \leq f_{VCO} \leq 300 \text{ MHz}$) which can be selected by PLLxFVCO (Bit [7:5] of Byte 6). The respective speed option assures stable operation and lowest jitter.

The divider M and divider N operates internally as fractional divider for f_{VCO} up to 250 MHz. This allows fractional divider ratio for zero ppm output clock error.

In case of $f_{VCO} > 250 \text{ MHz}$, it is recommended that integer factors of N/M are used only.

For optimized jitter performance, keep divider M as small as possible. Also, the fractional divider concept requires a PLL divider configuration, $M \leq N$ (or $N/M \geq 1$).

Additionally, each PLL supports two bypass options:

- PLL Bypass and
- VCO Bypass

In PLL bypass mode, the PLL completely is bypassed, so that the input clock is switched directly to the Output-Switch-A (SWAPxx of Byte 9 to 12). In the VCO bypass mode, only the VCO of the respective PLL is bypassed by setting PLLxMUX to 1 (Bit [7:5] of Byte 3). But the divider M still is useable and expands the output divider by additional 9-bits. This gives a total divider range of $M \times P = 511 \times 127 = 64897$. In VCO bypass mode the respective PLL block is powered down and minimizes current consumption.

Table 3. Example for Divide, Multiplication, and Bypass Operation

Function	Equation (1)	f _{IN} [MHz]	f _{OUT-desired} [MHz]	f _{OUT-actual} [MHz]	Divider				f _{VCO} [MHz]
					M	N	P	N/M	
Fractional ⁽²⁾	$f_{OUT} = f_{IN} \times (N/M)/P$	30.72	155.52	155.52	16	81	1	5.0625	155.52
Integer Factor ⁽³⁾	$f_{OUT} = f_{IN} \times (N/M)/P$	27	270	270	1	10	1	10	270
VCO bypass	$f_{OUT} = f_{IN}/(M \times P)$	30.72	0.06	0.06	8	—	64	—	—

(1) P-divider of Output-Switch-Matrix is included in the calculation.

(2) Fractional operation for $f_{VCO} \leq 250$ MHz.

(3) Integer operation for $f_{VCO} > 250$ MHz.

Spread Spectrum Clocking and EMI Reduction

In addition to the basic PLL function, PLL2 supports spread spectrum clocking (SSC) as well. Thus, PLL 2 features two outputs, a SSC output and a non-SSC output. Both outputs can be used in parallel. The mean phase of the Center Spread SSC modulated signal is equal to the phase of the non-modulated input frequency. SSC is selected by Output-Switch-A (SWAPxx of Byte 9 to 12).

SSC also is bypass-able (Byte 25, Bit [6:4]), which powers-down the SSC output and set it to logic low state. The non-SSC output of PLL2 is not affected by this mode and can still be used.

SSC is an effective method to reduce electro-magnetic interference (EMI) noise in high-speed applications. It reduces the RF energy peak of the clock signal by modulating the frequency and spread the energy of the signal to a broader frequency range. Because the energy of the clock signal remains constant, a varying frequency that broadens the overtones necessarily lowers their amplitudes. Figure 19 shows the effect of SSC on a 54-MHz clock signal for DSP

Figure 19. Spread Spectrum Clocking With Center Spread and Down Spread

The peak amplitude of the modulated clock is 11.3 dB lower than the non-modulated carrier frequency for down spread and radiated less electro-magnetic energy.

In SSC mode, the user can select the SSC modulation amount and SSC modulation frequency. The modulation amount is the frequency deviation based to the carrier (min/max frequency), whereas the modulation frequency determines the speed of the frequency variation. In SSC mode, the maximum VCO frequency is limited to 167 MHz.

SSC Modulation Amount

The CDC706 supports center spread modulation and down spread modulation. In center spread, the clock is symmetrically shifted around the carrier frequency and can be $\pm 0.1\%$, $\pm 0.25\%$, and $\pm 0.4\%$. At down spread, the clock frequency is always lower than the carrier frequency and can be 1%, 1.5%, 2%, and 3%. The down spread is preferred if a system can not tolerate an operating frequency higher than the nominal frequency (over-clocking problem).

Example:

	Modulation Type	Minimum Frequency	Center Frequency	Maximum Frequency
A	$\pm 0.25\%$ center spread	53.865 MHz	54 MHz	54.135 MHz
B	1% down spread	53.46 MHz	—	54 MHz
C	0.5% down spread ⁽¹⁾	53.73 MHz	53.865 MHz	54 MHz

(1) A down spread of 0.5% of a 54-MHz carrier is equivalent to 59.865 MHz at a center spread of $\pm 0.25\%$.

SSC Modulation Frequency

The modulation frequency (sweep rate) can be selected between 30 kHz and 60 kHz. It is also based on the VCO frequency as shown in the *SSC Modulation Frequency Selection*. As shown in [Figure 20](#), the damping increases with higher modulation frequencies. It may be limited by the tracking skew of a downstream PLL. The CDC706 uses a triangle modulation profile which is one of the common profiles for SSC.

Figure 20. EMI Reduction vs $f_{\text{Modulation}}$ and f_{Amount}

Further EMI Reduction

The optimum damping is a combination of modulation amount, modulation frequency and the harmonics which are considered. Note that higher order harmonic frequencies results in stronger EMI reduction because of respective higher frequency deviation.

As seen in [Figure 21](#) and [Figure 22](#), a slower output slew rate and/or smaller output signal amplitude helps to reduce EMI emission even more. Both measures reduce the RF energy of clock harmonics. The CDC706 allows slew rate control in four steps between 0.6 ns and 3.3 ns (Byte 19-24, Bit [5:4]). The output amplitude is set by the two independent output supply voltage pins, V_{CCOUT1} and V_{CCOUT2} , and can vary from 2.3 V to 3.6 V. Even a lower output supply voltage down to 1.8 V works, but the maximum frequency has to be considered.

Figure 21. EMI Reduction vs Slew-Rate and V_{CCOUT}

Figure 22. EMI Reduction vs V_{CCOUT}

Multi-Function Control Inputs S0 and S1

The CDC706 features two user definable inputs pins which can be used as external control pins or address pins. When programmed as control pins, they can function as clock select pin, enable/disable pin or device power-down pin. If both pins used as address-bits, up to four devices can be connected to the same SMBus. The respective function is set in Byte 10; Bit [3:0]. Table 4 shows the possible setting for the different output conditions, clock select and device addresses.

Table 4. Configuration Setting of Control Inputs

Configuration Bits				External Control Pins		Device Function			
Byte 10, Bit [3:2]		Byte 10, Bit [1:0]		S1 (Pin 2)	S0 (Pin 1)	Yx Outputs	Power Down	Pin 2	Pin 1
S11	S10	S01	S00						
0	X	0	X	1	1	Active	No	Output ctrl	Output ctrl
0	0	0	X	0	1	Low/High ⁽¹⁾	No	Output ctrl	Output ctrl
0	1	0	X	0	1	3-State	Outputs only	Output ctrl	Output ctrl
0	X	0	0	X	0	3-State	PLL, inputs and outputs	Output ctrl	Output ctrl and pd
0	X	0	1	0	0	S10=0: low/high ⁽¹⁾ S10=1: 3-State	PLL only	Output ctrl	PLL and Div bypass
0	X	0	1	1	0	Active	PLL only	Output ctrl	PLL and Div bypass
0	X	1	0	0	0/1 ⁽²⁾	S10=0: Low/High ⁽¹⁾ S10=1: 3-State	No	Output ctrl	CLK_SEL
0	X	1	0	1	0/1 ⁽²⁾	Active	No	Output ctrl	CLK_SEL

(1) A non-inverting output will be set to low and an inverting output will be set to high.

(2) If S0 is 0, CLK_IN0 is selected; if S0 is 1, CLK_IN1 is selected.

As shown in [Table 4](#), there is a specific order of the different output condition: Power-down mode overwrites 3-state, 3-state overwrites low-state, and low-state overwrites active-state.

Output Switching Matrix

The flexible architecture of the output switch matrix allows the user to switch any of the internal clock signal sources via a free-selectable post-divider to any of the six outputs.

As shown in [Figure 23](#), the CDC706 is based on two banks of switches and six post-dividers. Switch A comprises six *5-Input-Muxes* which selects one of the four PLL clock outputs or directly selects the input clock and feed it to one of the 7-bit post-divider (P-Divider). Switch B is made up of six *6-Input-Muxes* which takes any post-divider and feeds it to one of the six outputs, Yx.

Switch B was added to the output switch matrix to ensure that outputs frequencies derive from one P-divider are 100% phase aligned. Also, the P-divider is built in a way that every divide factor is automatically duty-cycle corrected. Changing the divider value on the fly may cause a glitch on the output.

Figure 23. CDC706 Output Switch Matrix

In addition, the outputs can be switched active, low or 3-state and/or 180 degree phase shifted. Also the outputs slew-rate and the output-voltage is user selectable.

LVC MOS Output Configuration

The output stage of the CDC706 supports all common output setting, such as enable, disable, low-state and signal inversion (180 degree phase shift). It further features slew-rate control (0.6 ns to 3.3 ns) and variable output supply voltage (2.3 V to 3.6 V).

Figure 24. Block Diagram of Output Architecture

Figure 25. Example for Output Waveforms

All output settings are programmable via SMBus:

- enable, disable, low-state via external control pins S0 and S1 → Byte 10, Bit[3:0]
- enable or disable-to-low → Byte 19 to 24, Bit[3]
- inverting/non-inverting → Byte 19 to 24, Bit[6]
- slew-rate control → Byte 19 to 24, Bit[5:4]
- output swing → external pins V_{CCOUT1} (Pin 14) and V_{CCOUT2} (Pin 18)

Performance Data: Output Skew, Jitter, Cross Coupling, Noise Rejection (Spur-Suppression), and Phase Noise

Output Skew

Skew is an important parameter for clock distribution circuits. It is defined as the time difference between outputs that are driven by the same input clock. [Table 5](#) shows the output skew ($t_{sk(o)}$) of the CDC706 for high-to-low and low-to-high transitions over the entire range of supply voltages, operating temperature and output voltage swing.

Table 5. Output Skew

PARAMETER	V _{ccout}	TYP	MAX	UNIT
$t_{sk(o)}$	2.5 V	130	250	ps
	3.3 V	130	200	ps

Jitter Performance

Jitter is a major parameter for PLL-based clock driver circuits. This becomes important as speed increases and timing budget decreases. The PLL and internal circuits of CDC706 are designed for lowest jitter. The peak-to-peak period jitter is only 60 ps (typical). [Table 6](#) gives the peak-to-peak and rms deviation of cycle-to-cycle jitter, period jitter and phase jitter as taken during characterization.

Table 6. Jitter Performance of CDC706

PARAMETER	f _{out}	TYP ⁽¹⁾		MAX ⁽¹⁾		UNIT
		Peak-Peak	rms (one sigma)	Peak-Peak	rms (one sigma)	
$t_{jit(cc)}$	50 MHz	55	–	75	–	ps
	133 MHz	50	–	85	–	
	245.76 MHz	45	–	60	–	
$t_{jit(per)}$	50 MHz	60	4	76	7	ps
	133 MHz	55	5	84	11	
	245.76 MHz	55	5	72	8	
$t_{jit(phase)}$	50 MHz	730	90	840	115	ps
	133 MHz	930	130	1310	175	
	245.76 MHz	720	90	930	125	

(1) All typical and maximum values are at V_{CC} = 3.3 V, temperature = 25°C, V_{ccout} = 3.3 V; one output is switching, data taken over several 10000 cycles.

[Figure 26](#), [Figure 27](#), and [Figure 28](#) show the relationship between cycle-to-cycle jitter, period jitter, and phase jitter over 10000 samples. The jitter varies with a smaller or wider sample window. The cycle-to-cycle jitter and period jitter show the measured value whereas the phase jitter is the accumulated period jitter.

Cycle-to-Cycle jitter ($t_{jit(cc)}$) is the variation in cycle time of a clock signal between adjacent cycles, over a random sample of adjacent cycle pairs. Cycle-to-cycle jitter will never be greater than the period jitter. It is also known as adjacent cycle jitter.

Figure 26. Snapshot of Cycle-to-Cycle Jitter

Period jitter ($t_{jit(per)}$) is the deviation in cycle time of a clock signal with respect to the ideal period ($1/f_0$) over a random sample of cycles. In reference to a PLL, period jitter is the worst-case period deviation from the ideal that would ever occur on the PLLs outputs. This is also referred to as short-term jitter.

Figure 27. Snapshot of Period Jitter

Phase jitter ($t_{jit(phase)}$) is the long-term variation of the clock signal. It is the cumulative deviation in $t(\Theta)$ for a controlled edge with respect to a $t(\Theta)$ mean in a random sample of cycles. Phase jitter, Time Interval Error (TIE), or Wander are used in literature to describe long-term variation in frequency. As of ITU-T: G.810, wander is defined as phase variation at rates less than 10 Hz while jitter is defined as phase variation greater than 10 Hz. The measurement interval must be long enough to gain a meaningful result. Wander can be caused by temperature drift, aging, supply voltage drift, etc.

Figure 28. Snapshot of Phase Jitter

Jitter depends on the VCO frequency (f_{VCO}) of the PLL. A higher f_{VCO} results in better jitter performance compared to a lower f_{VCO} . The VCO frequency can be defined via the M- and N-divider of the PLL

As the CDC706 supports a pretty wide frequency range, the device offers a VCO Frequency Selection Bit, Bit [7:5] of Byte 6. This bit defines the jitter-optimized frequency range of each PLL. The user can select between the normal-speed mode (80 MHz to 200 MHz) and the high-speed mode (180 MHz to 300 MHz). [Figure 29](#) shows the jitter performance over f_{VCO} for the two frequency ranges.

Figure 29. Period Jitter vs f_{VCO} for Normal-Speed Mode and High-Speed Mode

The TI Pro Clock software automatically calculates the PLL parameter for jitter-optimized performance.

Cross Coupling, Spur Suppression and Noise Rejection

Cross-Coupling in ICs occurs through interactions between several parts of the chip such as between output stages, metal lines, bond wires, substrate, etc. The coupling can be capacitive, inductive and resistive (ohmic) induced by output switching, leakage current, ground bouncing, power supply transients, etc.

The CDC706 is designed in a RFSiGe process technology incorporating silicon-germanium (SiGe) technology. This process gives excellent performance in linearity, low power consumption, best-in-class noise performance and very good isolation characteristic between the on-chip components.

The good isolation was a major criteria to use the RFSiGe process as it minimizes the coupling effect. Even if all three PLLs are active and all outputs are on, the noise suppression is clearly above 50 dB. Figure 30 and Figure 31 show an example of noise coupling, spur-suppression, and power supply noise rejection of CDC706. Die respective measurement conditions are shown in Figure 30 and Figure 31.

Figure 30. Noise Coupling and Spur Suppression

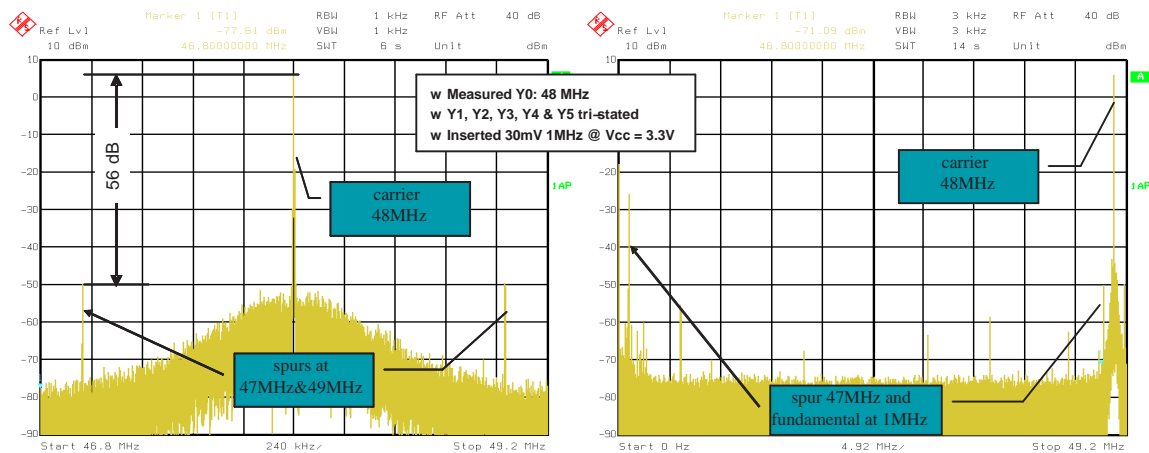

Figure 31. Power Supply Noise Rejection

Phase Noise Characteristic

In high-speed communication systems, the phase noise characteristic of the PLL frequency synthesizer is of high interest. Phase noise describes the stability of the clock signal in the frequency domain, similar to the jitter specification in the time domain.

Phase noise is a result of random and discrete noise causing a broad slope and spurious peaks. The discrete spurious components could be caused by known clock frequencies in the signal source, power line interference, and mixer products. The broadening caused by random noise fluctuation is due to phase noise. It can be the result of thermal noise, shot noise and/or flicker noise in active and passive devices.

Important factor for PLL synthesizer is the loop bandwidth (–3 dB cut-off frequency) — large loop bandwidth (LBW) results in fast transient response but have less reference spur attenuation. The LBW of the CDC706 is about 100 kHz to 250 kHz, dependent on selected PLL parameter.

For the CDC706, two phase noise characteristics are of interest: The phase noise of the crystal-input stage and the phase noise of the internal PLL (VCO). Figure 32 shows the respective phase noise characteristic.

Figure 32. Phase Noise Characteristic - f_{offset} - Hz

PLL Lock-Time

Some applications use frequency switching, i.e. to change frequency in TV application (switching between channels) or change the PCI-X frequency in computers. The time spent by the PLL in achieving the new frequency is of main interest. The lock time is the time it takes to jump from one specified frequency to another specified frequency within a given frequency tolerance (see Figure 33). It should be low, because a long lock time impacts the data rate of the system.

The PLL-Lock-Time depends on the device configuration and can be changed by the VCO frequency, i.e. by changing the M/N divider values. Table 7 gives the typical lock times of the CDC706 and Figure 33 shows a snapshot of a frequency switch.

Table 7. CDC706 PLL Lock-Times

Description	Lock Time	Unit
Frequency change via reprogramming of N/M counter	100	μ s
Frequency change via CLK_SEL pin (switching between CLK_IN0 and CLK_IN1)	100	μ s
Power-up lock time with system clock	50	μ s
Power-up lock time with 27 MHz Crystal at CLK_IN0 and CLK_IN1	300 ⁽¹⁾	μ s

(1) Is the result of Crystal lock time (200 μ s) and PLL lock time (100 μ s).

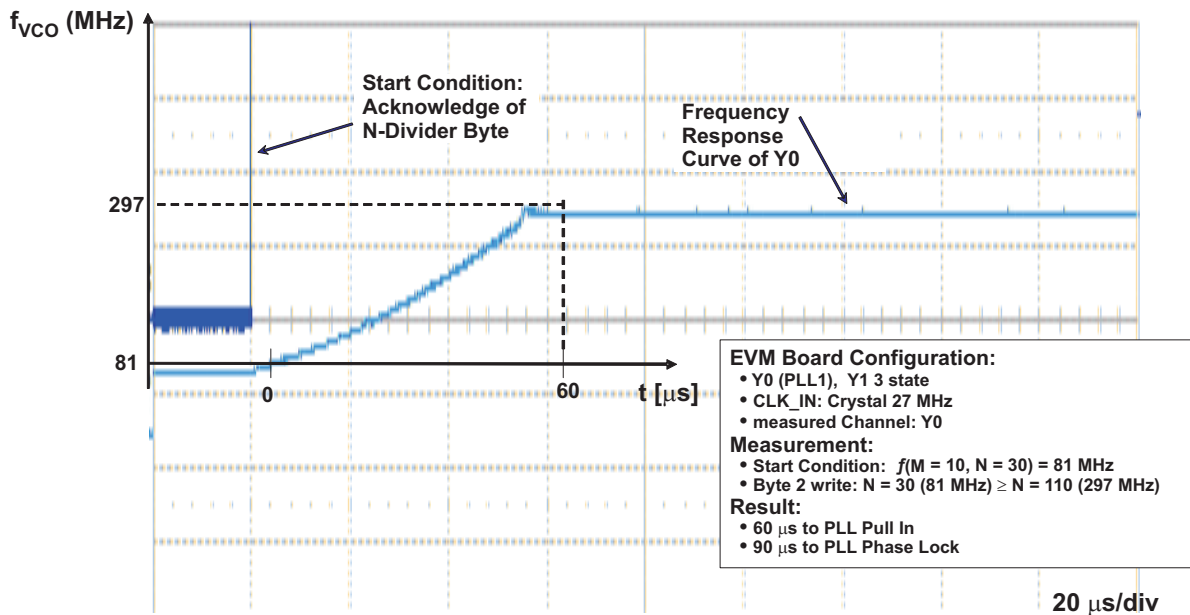

Figure 33. Snapshot of the PLL Lock-Time

Power Supply Sequencing

The CDC706 includes three power supply pins, V_{CC} , V_{CCOUT1} , and V_{CCOUT2} . There are no power supply sequencing requirements, as the three power nodes are separated from each other. So, power can be supplied in any order to the three nodes.

Also, the part has a power-up circuitry which switches the device on if V_{CC} exceeds 2.1 V (typical) and switches the device off at $V_{CC} < 1.7$ V (typical). In power-down mode, all outputs and clock inputs are switched off.

Device Behavior During Supply Voltage Drops

The CDC706 has a Power-Up-Circuit, which activates the device function at V_{PUC_ON} (typical 2.1 V). At the same time, the ROM information is loaded into the register. This mechanism ensures that there is a pre-defined default after Power-Up and no need to reprogram the CDC706 in the application.

In the event of a supply-voltage-drop, the Power-Up-Circuit assures that there is always a defined setup within the register. Figure 34 shows possible voltage drops with different amplitudes.

Figure 34. Different Voltage Drops on V_{CC} During Operation

The CDC706 Power-Up-Circuit has an inbuilt hysteresis. If the voltage stays above V_{PUC_OFF} , which is typically at 1.7 V, the register content stays unchanged. If the voltage drops below V_{PUC_OFF} , the internal register is reloaded by the ROM after V_{PUC_ON} is crossed again. V_{PUC_ON} is typically 2.1 V. Table 8 show the content of the ROM and the Register after above voltage drops scenarios.

Table 8. ROM and Register Content After V_{CC} Drop

Power Drop	ROM Content	Register Content
A	Unchanged	Unchanged
B	Unchanged	Unchanged
C	Unchanged	Reloaded from ROM
D	Unchanged	Reloaded from ROM

EVM and Programming SW

The CDC706 EVM is a development kit consisting of a performance evaluation module, the TI Pro Clock software, and the User's Guide. Contact Texas Instruments sales or marketing representative for more information.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
CDC706PW	NRND	TSSOP	PW	20	70	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM		CDC706	
CDC706PWG4	NRND	TSSOP	PW	20	70	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM		CDC706	
CDC706PWR	NRND	TSSOP	PW	20	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM		CDC706	
CDC706PWRG4	NRND	TSSOP	PW	20	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM		CDC706	

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
 - E. Falls within JEDEC MO-153

PW (R-PDSO-G20)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate design.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
