

1200 V Motion SPM[®] 2 Series

FNA23512A

Description

The FNA23512A is a Motion SPM 2 module providing a fully-featured, high-performance inverter output stage for AC induction, BLDC, and PMSM motors. These modules integrate optimized gate drive of the built-in IGBTs to minimize EMI and losses, while also providing multiple on-module protection features: under-voltage lockouts, over-current shutdown, temperature sensing, and fault reporting. The built-in, high-speed HVIC requires only a single supply voltage and translates the incoming logic-level gate inputs to high-voltage, high-current drive signals to properly drive the module's internal IGBTs. Separate negative IGBT terminals are available for each phase to support the widest variety of control algorithms.

Features

- UL Certified No. E209204 (UL1557)
- 1200 V – 35 A 3-Phase IGBT Inverter, Including Control ICs for Gate Drive and Protections
- Low-Loss, Short-Circuit-Rated IGBTs
- Very Low Thermal Resistance Using Al₂O₃ DBC Substrate
- Built-In Bootstrap Diodes and Dedicated Vs Pins Simplify PCB Layout
- Separate Open-Emitter Pins from Low-Side IGBTs for Three-Phase Current Sensing
- Single-Grounded Power Supply Supported
- Built-In NTC Thermistor for Temperature Monitoring and Management
- Adjustable Over-Current Protection via Integrated Sense-IGBTs
- Isolation Rating of 2500 Vrms / 1 min.
- These Device is Halide Free and is RoHS Compliant

Applications

- Motion Control – Industrial Motor (AC 400 V Class)

Integrated Power Functions

- 1200 V – 35 A IGBT inverter for three-phase DC / AC power conversion (refer to Figure 2)

Integrated Drive, Protection and System Control Functions

- For Inverter High-Side IGBTs: gate-drive circuit, high-voltage isolated high-speed level-shifting control circuit, Under-Voltage Lock-Out Protection (UVLO), Available bootstrap circuit example is given in Figures 4 and 14.

- For inverter low-side IGBTs: gate-drive circuit, Short-Circuit Protection (SCP) control circuit, Under-Voltage Lock-Out Protection (UVLO)
- Fault signaling: corresponding to UV (low-side supply) and SC faults
- Input interface: active-HIGH interface, works with 3.3 / 5 V logic, Schmitt-trigger input

7. Short-circuit current protection functions only at the low-sides because the sense current is divided from main current at low-side IGBTs. Inserting the shunt resistor for monitoring the phase current at N_U , N_V , N_W terminal, the trip level of the short-circuit current is changed.

8. The fault-out pulse width t_{FOD} depends on the capacitance value of C_{FOD} according to the following approximate equation :
 $t_{FOD} = 0.8 \times 10^6 \times C_{FOD} [\text{s}]$.

9. T_{TH} is the temperature of thermistor itself. To know case temperature (T_C), conduct experiments considering the application.

Figure 8. Flatness Measurement Position

Figure 9. Mounting Screws Torque Order

- 12. Do not over torque when mounting screws. Too much mounting torque may cause DBC cracks, as well as bolts and Al heat-sink destruction.
- 13. Avoid one-sided tightening stress. Figure 9 shows the recommended torque order for the mounting screws. Uneven mounting can cause the DBC substrate of package to be damaged. The pre-screwing torque is set to 20 ~ 30% of maximum torque rating.

Input/Output Interface Circuit

Figure 13. Recommended MCU I/O Interface Circuit

14. RC coupling at each input might change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. The input signal section of the Motion SPM 2 product integrates 5 kΩ (typ.) pull-down resistor. Therefore, when using an external filtering resistor, please pay attention to the signal voltage drop at input terminal.

FNA23512A

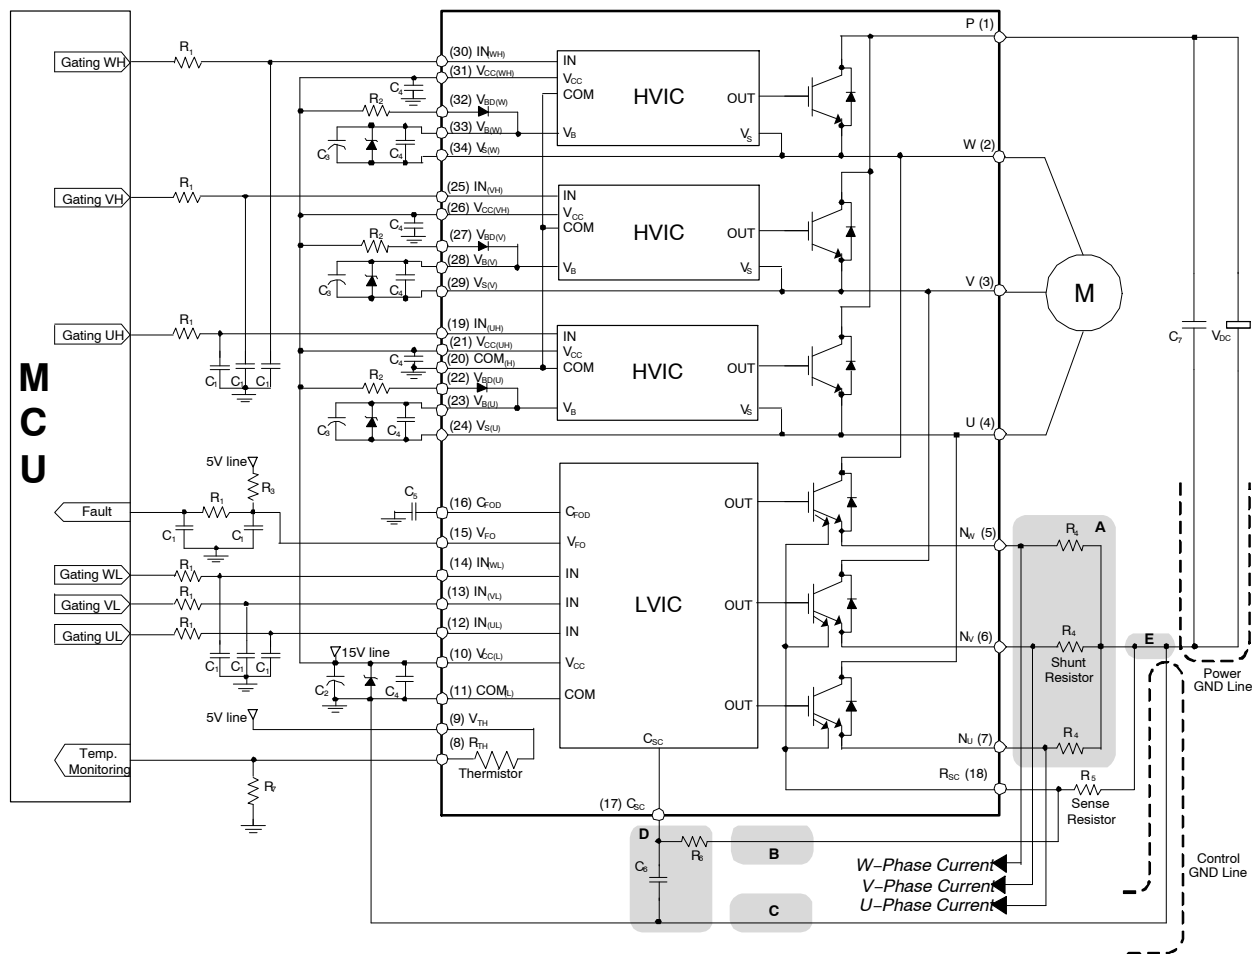

Figure 14. Typical Application Circuit

15. To avoid malfunction, the wiring of each input should be as short as possible (less than 2 – 3 cm).
16. V_{FO} output is an open-drain type. This signal line should be pulled up to the positive side of the MCU or control power supply with a resistor that makes I_{FO} up to 2 mA. Please refer to Figure 13.
17. Fault out pulse width can be adjusted by capacitor C_5 connected to the C_{FOD} terminal.
18. Input signal is active-HIGH type. There is a 5 k Ω resistor inside the IC to pull-down each input signal line to GND. RC coupling circuits should be adopted for the prevention of input signal oscillation. R_1C_1 time constant should be selected in the range 50 ~ 150 ns (recommended $R_1 = 100 \Omega$, $C_1 = 1 \text{ nF}$).
19. Each wiring pattern inductance of point A should be minimized (recommend less than 10 nH). Use the shunt resistor R_4 of surface mounted (SMD) type to reduce wiring inductance. To prevent malfunction, wiring of point E should be connected to the terminal of the shunt resistor R_4 as close as possible.
20. To insert the shunt resistor to measure each phase current at N_U , N_V , N_W terminal, it makes to change the trip level I_{SC} about the short-circuit current.
21. To prevent errors of the protection function, the wiring of points B, C, and D should be as short as possible. The wiring of B between C_{SC} filter and R_{SC} terminal should be divided at the point that is close to the terminal of sense resistor R_5 .
22. For stable protection function, use the sense resistor R_5 with resistance variation within 1% and low inductance value.
23. In the short-circuit protection circuit, select the R_6C_6 time constant in the range 1.0 ~ 1.5 μs . R_6 should be selected with a minimum of 10 times larger resistance than sense resistor R_5 . Do enough evaluation on the real system because short-circuit protection time may vary wiring pattern layout and value of the R_6C_6 time constant.
24. Each capacitor should be mounted as close to the pins of the Motion SPM 2 product as possible.
25. To prevent surge destruction, the wiring between the smoothing capacitor C_7 and the P & GND pins should be as short as possible. The use of a high-frequency non-inductive capacitor of around 0.1 ~ 0.22 μF between the P & GND pins is recommended.
26. Relays are used at almost every systems of electrical equipments at industrial application. In these cases, there should be sufficient distance between the CPU and the relays.
27. The zener diode or transient voltage suppressor should be adopted for the protection of ICs from the surge destruction between each pair of control supply terminals (recommended Zener diode is 22 V / 1 W, which has the lower zener impedance characteristic than about 15 Ω).
28. C_2 of around 7 times larger than bootstrap capacitor C_3 is recommended.
29. Please choose the electrolytic capacitor with good temperature characteristic in C_3 . Also, choose 0.1 ~ 0.2 μF R-category ceramic capacitors with good temperature and frequency characteristics in C_4 .
