PGA2311

SBOS218D – DECEMBER 2001 – REVISED MAY 2016

PGA2311
Stereo Audio Volume Control

1 Features

- Digitally-Controlled Analog Volume Control:
  - Two Independent Audio Channels
  - Serial Control Interface
  - Zero Crossing Detection
  - Mute Function
- Wide Gain and Attenuation Range:
  +31.5 dB to −95.5 dB with 0.5-dB Steps
- Low Noise and Distortion:
  - 120-dB Dynamic Range
  - 0.0004% THD+N at 1 kHz (U-Grade)
  - 0.0002% THD+N at 1 kHz (A-Grade)
- Noise-Free Level Transitions
- Low Interchannel Crosstalk: −130 dBFS
- Power Supplies: ±5-V Analog, +5-V Digital
- Available in PDIP-16 and SOIC-16 Packages
- Pin- and Software-Compatible With the Crystal
  CS3310

2 Applications

- Audio Amplifiers
- Mixing Consoles
- Multi-Track Recorders
- Broadcast Studio Equipment
- Musical Instruments
- Effects Processors
- A/V Receivers
- Car Audio Systems

3 Description

The PGA2311 device is a high-performance, stereo audio volume control designed for professional and high-end consumer audio systems. The PGA2311 uses an internal high-performance operational amplifier to yield low noise and distortion. The PGA2311 also provides the capability to drive 660-Ω loads directly without buffering. The 3-wire serial control interface allows for connection to a wide variety of host controllers, in addition to support for daisy-chaining of multiple PGA2311 devices.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
PGA2311	SOIC (16)	7.5 mm × 10.30 mm
	PDIP (16)	6.35 mm × 19.30 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (May 2016) to Revision D **Page**

- Changed the values of Voltage range, PGA2311PA, UA (A−grade) To: (V_A-) = + 1.25 V, and (V_A-) = −1.25 V in the *Electrical Characteristics* table 5
- Chnaged the Quiescent current Test Conditions To: V_A = +5 V, and V_A = −5 V in the *Electrical Characteristics* table 6

Changes from Revision B (January 2016) to Revision C **Page**

- Changed package family terms in second to last Features bullet 1
- Changed description of pin 7 in *Pin Functions* table 3
- Deleted lead temperature and package temperature rows from *Absolute Maximum Ratings* table 4

Changes from Revision A (June 2002) to Revision B **Page**

- Added *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section. 1

6   Specifications

6.1   Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
Supply voltage	V_A+		5.5	V
	V_A-		−5.5	
	V_D+		5.5	
	V_A+ to V_D+		< ±0.3	
Analog input voltage		0	V_A+, V_A-	V
Digital input voltage		−0.3	V_D+	V
Operating temperature		−40	85	°C
Junction temperature			150	°C
Storage temperature, T_{stg}		−65	150	°C

(1)   Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2   ESD Ratings

			VALUE	UNIT
PGA2311 in 16-Pin SOIC Package				
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±1500	
PGA2311 in 16-Pin PDIP Package				
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V

(1)   JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2)   JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3   Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_A+	Positive analog power supply	4.75	5	5.25	V
V_A-	Negative analog power supply	−4.75	−5	−5.25	V
V_D+	Digital power supply	4.75	5	5.25	V
	Operating temperature	−40	25	85	°C

6.4   Thermal Information

		PGA2311		UNIT
THERMAL METRIC[1]		N (PDIP)	DW (SOIC)	
		16 PINS	**16 PINS**	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	39.9	83	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	26.2	44	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	20.1	40.5	°C/W
ψ_{JT}	Junction-to-top characterization parameter	10.7	11.5	°C/W
ψ_{JB}	Junction-to-board characterization parameter	19.9	40.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	—	°C/W

(1)   For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

6.5 Electrical Characteristics

At T_A = +25°C, V_A+ = +5 V, V_A− = −5 V, V_D+ = +5 V, R_L = 100 kΩ, C_L = 20 pF, BW measure = 10 Hz to 20 kHz, unless otherwise noted.

7 Detailed Description

7.1 Overview

The PGA2311 is a stereo audio volume control that can be used in a wide array of professional and consumer audio equipment. The PGA2311 is fabricated in a sub-micron CMOS process.

The heart of the PGA2311 is a resistor network, an analog switch array, and a high-performance operational amplifier stage. The switches select taps in the resistor network that determine the gain of the amplifier stage. Switch selections are programmed using a serial control port. The serial port allows connection to a wide variety of host controllers. The *Functional Block Diagram* section shows a model diagram of the PGA2311.

7.2 Functional Block Diagram
Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 Analog Inputs and Outputs

The PGA2311 includes two independent channels (referred to as the left and right channels). Each channel has a corresponding input and output pin. The input and output pins are unbalanced, or referenced to analog ground (either AGNDR or AGNDL). The inputs are $V_{IN}R$ (pin 9) and $V_{IN}L$ (pin 16), and the outputs are $V_{OUT}R$ (pin 11) and $V_{OUT}L$ (pin 14). The input and output pins can swing within 1.25 V of the analog power supplies, V_A+ (pin 12) and V_A- (pin 13). Given $V_A+ = +5$ V and $V_A- = -5$ V, the maximum input or output voltage range is 7.5 Vp-p.

For optimal performance, drive the PGA2311 with a low source impedance. A source impedance of 600 Ω or less is recommended. Source impedances up to 2 kΩ cause minimal degradation of THD+N; see Figure 8 for more details.

Feature Description (continued)

7.3.2 Gain Settings

The gain for each channel is set by its corresponding 8-bit code, either R[7:0] or L[7:0] (see Figure 1). The gain code data is straight binary format. If N equals the decimal equivalent of R[7:0] or L[7:0], then the following relationships exist for the gain settings:

- For N = 0: Mute Condition. The input multiplexer is connected to analog ground (AGNDR or AGNDL).
- For N = 1 to 255: Gain (dB) = 31.5 − [0.5 w (255 − N)]

This results in a gain range of +31.5 dB (with N = 255) to −95.5 dB (with N = 1).

Changes in gain setting can be made with or without zero-crossing detection. The operation of the zero-crossing detector and timeout circuitry is discussed in the *Zero-Crossing Detection* section.

7.3.3 Daisy-Chaining Multiple PGA2311 Devices

To reduce the number of control signals required to support multiple PGA2311 devices on a printed circuit board (PCB), the serial control port supports daisy-chaining of multiple PGA2311 devices. Figure 12 shows the connection requirements for daisy-chain operation. This arrangement allows a 3-wire serial interface to control many PGA2311 devices.

As shown in Figure 12, the SDO pin from PGA2311 #1 is connected to the SDI input of PGA2311 #2, and is repeated for additional devices. This configuration in turn forms a large shift register, in which gain data can be written for all PGA2311s connected to the serial bus. The length of the shift register is 16 × N bits, where N is equal to the number of PGA2311 devices included in the chain. The $\overline{CS}$ input must remain LOW for 16 × N SCLK periods, where N is the number of devices connected in the chain, to allow enough SCLK cycles to load all devices.

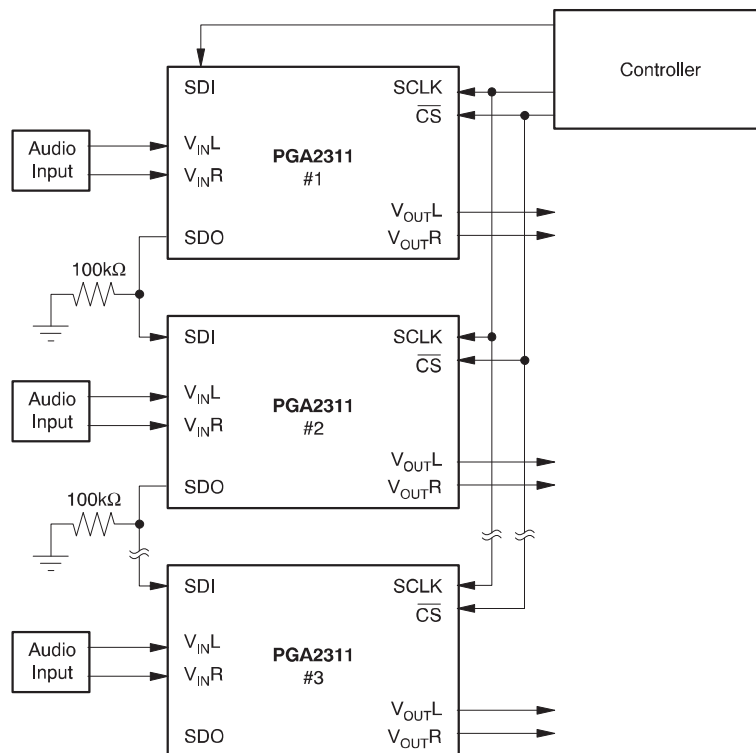

Figure 12. Daisy-Chaining Multiple PGA2311 Devices

Feature Description (continued)

7.3.4 Zero-Crossing Detection

The PGA2311 includes a zero-crossing detection function for noise-free level transitions. The concept is to change gain settings on a zero-crossing of the input signal, thus minimizing audible glitches. This function is enabled or disabled using the ZCEN input (pin 1). When ZCEN is LOW, zero-crossing detection is disabled. When ZCEN is HIGH, zero-crossing detection is enabled.

The zero-crossing detection takes effect with a change in gain setting for a corresponding channel. The new gain setting is not implemented until either a positive slope zero crossing is detected, or a time-out period of 16 ms has elapsed. In the case of a time-out, the new gain setting takes effect with no attempt to minimize audible artifacts.

7.3.5 $\overline{MUTE}$ Function

Muting can be achieved by either hardware or software control. Hardware muting is accomplished through the $\overline{MUTE}$ input, and software muting by loading all zeroes into the volume control register.

$\overline{MUTE}$ disconnects the internal buffer amplifiers from the output pins and terminates $A_{OUT}L$ and $A_{OUT}R$ with 10-kΩ resistors to ground. The mute is activated with a zero-crossing detection (independent of the zero-cross enable status), or an 16-ms time-out to eliminate any audible clicks or pops. $\overline{MUTE}$ also initiates an internal offset calibration.

A software mute is implemented by loading all zeroes into the volume control register. The internal amplifier is set to unity gain, with the amplifier input connected to AGND.

7.4 Device Functional Modes

7.4.1 Power-Up State

On power-up, power-up reset is activated for approximately 100 ms, during which the circuit is in hardware $\overline{MUTE}$ state and all internal flip-flops are reset. At the end of this period, the offset calibration is initiated without any external signals. When this step is complete, the gain byte value for both the left and right channels are set to 00_{HEX}, or the software $\overline{MUTE}$ condition. The gain remains at this setting until the host controller programs new settings for each channel via the serial control port.

If the power-supply voltage drops below ±3.2 V during normal operation, the circuit enters a hardware MUTE state. A power-up sequence initiates if the power-supply voltage returns to greater than ±3.2 V.

7.5 Programming

The serial control port is used to program the gain settings for the PGA2311. The serial control port includes three input pins and one output pin. The inputs include $\overline{CS}$ (pin 2), SDI (pin 3), and SCLK (pin 6). The sole output pin is SDO (pin 7).

The $\overline{CS}$ pin functions as the chip-select input. Data can be written to the PGA2311 only when $\overline{CS}$ is LOW. SDI is the serial data input pin. Control data are provided as a 16-bit word at the SDI pin, 8 bits each for the left and right channel gain settings.

Data are formatted as MSB first, in straight binary code. SCLK is the serial clock input. Data are clocked into SDI on the rising edge of SCLK.

SDO is the serial data output pin, and used when daisy-chaining multiple PGA2311 devices. Daisy-chain operation is described in the *Daisy-Chaining Multiple PGA2311 Devices* section. SDO is a tri-state output, and assumes a high-impedance state when $\overline{CS}$ is HIGH.

The protocol for the serial control port is illustrated in Figure 1; see Figure 2 for detailed timing specifications for the serial control port.

8 Application and Implementation

> **NOTE**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The PGA2311 is commonly used as a digitally-controlled analog volume control. Analog volume is controlled through a serial interface in 0.5-dB steps, ranging from a gain of +31.5 dB down to an attenuation of −95.5 dB.

8.2 Typical Application

Figure 13 shows the recommended connections for the PGA2311. Place power-supply bypass capacitors as close to the PGA2311 package as physically possible.

C_2, C_3, C_5 = 0.1μF ceramic or metal film.
C_1, C_4, C_6 = 10μF tantalum or aluminum electrolytic.

Copyright © 2016, Texas Instruments Incorporated

Figure 13. Recommended Connection Diagram

8.2.1 Design Requirements

- Wide dynamic range, +35.5 dB to –95.5 dB
- Operate from a 5-V digital supply and ±5-V analog supplies
- Digitally-controlled analog volume

8.2.2 Detailed Design Procedure

The PGA2311 is a complete digitally-controlled analog stereo volume controller system on a chip requiring only a controller to select the gain or attenuation through a serial interface. Figure 13 shows the basic connections to the PGA2311. Place power-supply bypass capacitors as close to the PGA2311 package as physically possible.

Typical Application (continued)

8.2.3 Application Curve

Figure 14. PGA2311 Operating at 0 dB, –6 dB and –12 dB

9 Power Supply Recommendations

The PGA2311 is specified for operation with its analog power supplies ranging from ±4.75 V to ±5.25 V and its digital power supply ranging from 4.75 V to 5.25 V. Place power-supply bypass capacitors as close to the PGA2311 package as physically possible.

Product Folder Links: *PGA2311*

10 Layout

10.1 Layout Guidelines

The ground planes for the digital and analog sections of the PCB must be separate from one another. The planes must be connected at a single point. Figure 15 shows the recommended PCB floor plan for the PGA2311.

The PGA2311 is mounted so that the device straddles the split between the digital and analog ground planes. Pins 1 through 8 are oriented to the digital side of the board and pins 9 through 16 are on the analog side of the board.
10.2 Layout Example

E2E Audio Amplifier Forum *TI's Engineer-to-Engineer (E2E) Community for Audio Amplifiers.* Created to foster collaboration among engineers. Ask questions and receive answers in real-time.

11.3 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

[3] MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[4] There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

[5] Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

[6] Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing
   per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
   exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.
5. Reference JEDEC registration MS-013.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
