

SN65DSI83 MIPI® DSI Bridge to FlatLink™ LVDS

Single-Channel DSI to Single-Link LVDS Bridge

1 Features

- Implements MIPI D-PHY Version 1.00.00 Physical Layer Front-End and Display Serial Interface (DSI) Version 1.02.00
- Single Channel DSI Receiver Configurable for 1, 2, 3, or 4 D-PHY Data Lanes Per Channel Operating up to 1 Gbps/Lane
- Supports 18 bpp and 24 bpp DSI Video Packets With RGB666 and RGB888 Formats
- Max Resolution up to 60 fps WUXGA 1920 × 1200 at 18 bpp and 24 bpp Color With Reduced Blanking. Suitable for 60 fps 1366 × 768 / 1280 × 800 at 18 bpp and 24 bpp
- FlatLink Output for Single-Link LVDS
- Supports Single Channel DSI to Single-Link LVDS Operating Mode
- LVDS Output Clock Range of 25 MHz to 154 MHz
- LVDS Pixel Clock May be Sourced from Free-Running Continuous D-PHY Clock or External Reference Clock (REFCLK)
- 1.8-V Main V_{CC} Power Supply
- Low Power Features Include Shutdown Mode, Reduced LVDS Output Voltage Swing, Common Mode, and MIPI Ultra-Low Power State (ULPS) Support
- LVDS Channel SWAP, LVDS PIN Order Reverse Feature for Ease of PCB Routing
- ESD Rating ±2 kV (HBM)
- Packaged in 64-pin 5-mm × 5-mm BGA MICROSTAR JUNIOR (ZQE)
- Temperature Range: –40°C to 85°C

2 Applications

- Tablet PC, Notebook PC, Netbooks
- Mobile Internet Devices

3 Description

The SN65DSI83 DSI to FlatLink bridge device features a single-channel MIPI D-PHY receiver front-end configuration with four lanes per channel operating at 1 Gbps per lane; a maximum input bandwidth of 4 Gbps. The bridge decodes MIPI DSI 18 bpp RGB666 and 24 bpp RGB888 packets and converts the formatted video data stream to a FlatLink-compatible LVDS output operating at pixel clocks operating from 25 MHz to 154 MHz, offering a Single-Link LVDS with four data lanes per link.

The SN65DSI83 device can support up to WUXGA 1920 × 1200 at 60 frames per second, at 24 bpp with reduced blanking. The SN65DSI83 device is also suitable for applications using 60 fps 1366 × 768 / 1280 × 800 at 18 bpp and 24 bpp. Partial line buffering is implemented to accommodate the data stream mismatch between the DSI and LVDS interfaces.

Designed with industry-compliant interface technology, the SN65DSI83 device is compatible with a wide range of microprocessors, and is designed with a range of power management features including low-swing LVDS outputs, and the MIPI defined ultra-low power state (ULPS) support.

The SN65DSI83 device is implemented in a small outline 5-mm × 5-mm BGA MICROSTAR JUNIOR at 0.5-mm pitch package, and operates across a temperature range from –40°C to 85°C.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE
SN65DSI83	BGA MICROSTAR JUNIOR (64)	5.00 mm × 5.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

Changes from Revision F (May 2015) to Revision G	Page
• Moved <i>Recommended Initialization Setup Sequence</i>	15
• Changed <i>SN65DSI83 DSI Lane Merging Illustration</i> back to original image	17

Changes from Revision E (October 2013) to Revision F	Page
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1
• Updated data sheet to new TI standards, added sections, and rearranged content	1
• Updated the <i>SN65DSI83 FlatLink Timing Definitions</i> diagram.....	11
• Changed the notes for the <i>Shutdown and RESET Timing Definition While V_{CC} is High</i> diagram.....	11
• Changed <i>Functional Block Diagram</i>	12
• Changed <i>SN65DSI83 DSI Lane Merging Illustration</i>	17
• Changed from: 1366 x 768 WXGA to:1280 x 800 WXGA	29
• Changed <i>Design Parameters</i> table values	29
• Changed <i>Detailed Design Procedure</i> values and text.....	30
• Changed <i>Example Script</i> subsection	32

Changes from Revision D (December 2012) to Revision E	Page
• Changed status from Product Preview to Production Data.....	1

Changes from Revision A (September 2012) to Revision B	Page
• Changed the value of V_{OH} From: 1.3 MIN To: 1.25 MIN	7
• Changed the I_{CC} TYP value From: TBD To: 77 and MAX value From: TBD To: 112	7
• Added a TYP value of 7.7 to I_{ULPS}	7
• Changed the I_{RST} TYP value From: 0.05 To: 0.04 and MAX value From: 0.2 To: 0.06	7
• Added table note 2	7
• changed the values of VOD 	8
• Changed the values of $V_{OC(SS)}$ for test conditions CSR 0x19.6 = 0	8
• Added table note 3	8
• Changed the t_{setup} and t_{hold} NOM value of 1.5 to a MIN value of 1.5	8
• Changed the SWITCHING CHARACTERISTICS table	9
• Changed the description of CHA_LVDS_VOD_SWING	24

Changes from Original (August 2012) to Revision A	Page
• Changed Feature From: Max Resolution up to 60 fps WUXGA 1920 × 1200 at 18 and 24 bpp Color with Reduced Blanking. Suitable for 60 fps 1366 × 768 at 18 and 24 bpp To: Max Resolution up to 60 fps WUXGA 1920 × 1200 at 18 and 24 bpp Color with Reduced Blanking. Suitable for 60 fps 1366 × 768 / 1280 × 800 at 18 and 24 bpp	1
• Changed text in paragraph two of the Description From: "applications using 60 fps 1366 × 768 at 18 bpp and 24 bpp." To: "applications using 60 fps 1366 × 768 / 1280 × 800 at 18 bpp and 24 bpp."	1

5 Pin Configuration and Functions

ZQE Package
64-Pin BGA MICROSTAR JUNIOR
(Top View)

Pin Functions

PIN		I/O	DESCRIPTION
SIGNAL	NUMBER		
A_CLKN	F9	LVDS output	FlatLink Channel A LVDS clock
A_CLKP	F8		
ADDR	A1	CMOS I/O	Local I ² C Interface Target Address Select. See Table 3 . In normal operation, this pin is an input. When the ADDR pin is programmed high, it must be tied to the same 1.8-V power rails where the SN65DSI83 VCC 1.8-V power rail is connected.
A_Y0N	C9	LVDS output	FlatLink Channel A LVDS data output 0
A_Y0P	C8		
A_Y1N	D9		
A_Y1P	D8		
A_Y2N	E9		
A_Y2P	E8		
A_Y3N	G9		
A_Y3P	G8		

Pin Functions (continued)

PIN		I/O	DESCRIPTION								
SIGNAL	NUMBER										
DA0N	J3	LVDS Input (HS) CMOS Input (LS) (failsafe)	MIPI D-PHY Channel A Data Lane 0; data rate up to 1 Gbps								
DA0P	H3		MIPI D-PHY Channel A Data Lane 0; data rate up to 1 Gbps								
DA1N	J4			MIPI D-PHY Channel A Data Lane 1; data rate up to 1 Gbps							
DA1P	H4				MIPI D-PHY Channel A Data Lane 1; data rate up to 1 Gbps						
DA2N	J6					MIPI D-PHY Channel A Data Lane 2; data rate up to 1 Gbps					
DA2P	H6						MIPI D-PHY Channel A Data Lane 2; data rate up to 1 Gbps				
DA3N	J7							MIPI D-PHY Channel A Data Lane 3; data rate up to 1 Gbps			
DA3P	H7								MIPI D-PHY Channel A Data Lane 3; data rate up to 1 Gbps		
DACN	J5									MIPI D-PHY Channel A Clock Lane; operates up to 500 MHz	
DACP	H5										MIPI D-PHY Channel A Clock Lane; operates up to 500 MHz
EN	B1	CMOS Input with pullup (failsafe)									
GND	A2, A8, B9, D5, E4, F4, F5, H9	Power Supply	Reference ground								
IRQ	J9	CMOS Output	Interrupt signal								
NC	B3, A3, B4, A4, B5, A5, B6, A6, B7, A7, C2, C1, D2, D1, F2, F1, G2, G1, E2, E1	No connects	These pins must not be connected to any signal, power or ground.								
REFCLK	H2	CMOS Input (Failsafe)	Optional external reference clock for LVDS pixel clock. If an external reference clock is not used, this pin must be pulled to GND with an external resistor. The source of the reference clock must be placed as close as possible with a series resistor near the source to reduce EMI.								
RSVD1	H8	CMOS Input/Output with pulldown	Reserved. This pin must be left unconnected for normal operation.								
RSVD2	B2	CMOS Input with pulldown	Reserved. This pin must be left unconnected for normal operation.								
SCL	H1	CMOS Input (Failsafe)	Local I ² C interface clock								
SDA	J1	Open Drain I/O (failsafe)	Local I ² C interface bidirectional data signal								
VCC	A9, B8, D6, E5, E6, F6, J2	Power Supply	1.8-V power supply								
VCORE	J8		1.1-V output from voltage regulator. This pin must have a 1- μ F external capacitor to GND.								

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature (unless otherwise noted)

		MIN	MAX	UNIT
Supply voltage, V_{CC}		-0.3	2.175	V
Input voltage	CMOS input pins	-0.5	2.175	V
	DSI input pins (DA × P/N, DB × P/N)	-0.4	1.4	V
Storage temperature, T_{stg}		-65	105	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	VCC power supply	1.65	1.8	1.95	V
V_{PSN}	Supply noise on any V_{CC} pin	$f_{(noise)} > 1$ MHz		0.05	V
T_A	Operating free-air temperature	-40		85	°C
T_{CASE}	Case temperature			92.2	
V_{DSL_PIN}	DSI input pin voltage range	-50		1350	mV
Z_L	LVDS output differential impedance	90		132	Ω

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		SN65DSI83		UNIT
		ZQE (BGA MICROSTAR JUNIOR)		
		64 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance	72.1		°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	35.7		
$R_{\theta JB}$	Junction-to-board thermal resistance	35.2		
Ψ_{JT}	Junction-to-top characterization parameter	1.2		
Ψ_{JB}	Junction-to-board characterization parameter	36.1		

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
V _{IL}	Low-level control signal input voltage				0.3 × V _{CC}	V
V _{IH}	High-level control signal input voltage		0.7 × V _{CC}			
V _{OH}	High-level output voltage	I _{OH} = -4 mA	1.25			
V _{OL}	Low-level output voltage	I _{OL} = 4 mA			0.4	
I _{LKG}	Input failsafe leakage current	V _{CC} = 0; V _{CC(PIN)} = 1.8 V			±30	μA
I _{IH}	High-level input current	Any input pin			±30	
I _{IL}	Low-level input current					
I _{OZ}	High-impedance output current	Any output pin			±10	
I _{OS}	Short-circuit output current	Any output driving GND short			±20	mA
I _{CC}	Device active current	See ⁽²⁾		77	112	mA
I _{ULPS}	Device standby current	All data and clock lanes are in ultra-low power state (ULPS)		7.7	10	
I _{RST}	Shutdown current	EN = 0		0.04	0.06	
R _{EN}	EN control input resistor			200		
MIPI DSI INTERFACE						
V _{IH-LP}	LP receiver input high threshold	See Figure 2		880		mV
V _{IL-LP}	LP receiver input low threshold					
V _{ID}	HS differential input voltage		70		270	
V _{IDT}	HS differential input voltage threshold				50	
V _{IL-ULPS}	LP receiver input low threshold; ultra-low power state (ULPS)				300	
V _{CM-HS}	HS common mode voltage; steady-state		70		330	
ΔV _{CM-HS}	HS common mode peak-to-peak variation including symbol delta and interference				100	
V _{IH-HS}	HS single-ended input high voltage	See Figure 2			460	
V _{IL-HS}	HS single-ended input low voltage			-40		
V _{TERM-EN}	HS termination enable; single-ended input voltage (both Dp and Dn apply to enable)	Termination is switched simultaneous for Dn and Dp			450	
R _{DIFF-HS}	HS mode differential input impedance		80		125	Ω

- (1) All typical values are at V_{CC} = 1.8 V and T_A = 25°C.
 (2) SN65DSI83: SINGLE Channel DSI to SINGLE Channel DSI, 1280 × 800
 (a) Number of LVDS lanes = 3 data lanes + 1 CLK lane
 (b) Number of DSI lanes = 4 data lanes + 1 CLK lane
 (c) LVDS CLK OUT = 83 M
 (d) DSI CLK = 500 M
 (e) RGB888, LVDS 18 bpp
 Maximum values are at V_{CC} = 1.95 V and T_A = 85°C

EN, ULPS, RESET						
t_{en}	Enable time from EN or ULPS	$t_{c(o)} = 12.9$ ns			1	ms
t_{dis}	Disable time to standby; see Figure 5				0.1	
t_{reset}	Reset Time			10		ms
REFCLK						
F_{REFCLK}	REFCLK frequency. Supported frequencies: 25 MHz to 154 MHz		25		154	MHz
t_r, t_f	REFCLK rise and fall time		100 ps		1 ns	s
t_{pj}	REFCLK peak-to-peak phase jitter				50	ps
Duty	REFCLK duty cycle		40%	50%	60%	
REFCLK or DSI CLK (DACP/N, DBCP/N)						
SSC_CLKIN	SSC enabled input CLK center spread depth ⁽²⁾		0.5%	1%	2%	
	Modulation frequency range		30		60	kHz

(1) All typical values are at $V_{CC} = 1.8$ V and $T_A = 25^\circ\text{C}$

(2) For EMI reduction purpose, the SN65DSI83 device supports the center spreading of the LVDS CLK output through the REFCLK or DSI CLK input. The center spread CLK input to the REFCLK or DSI CLK is passed through to the LVDS CLK output A_CLKP and A_CLKN, or B_CLKP and B_CLKN, or both.

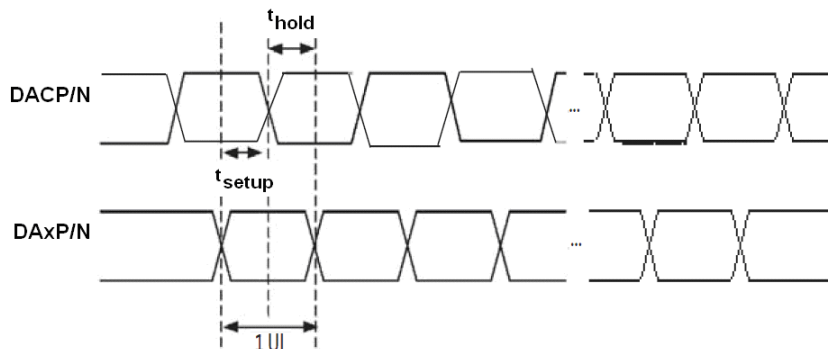

Figure 1. DSI HS Mode Receiver Timing Definitions

Figure 2. DSI Receiver Voltage Definitions

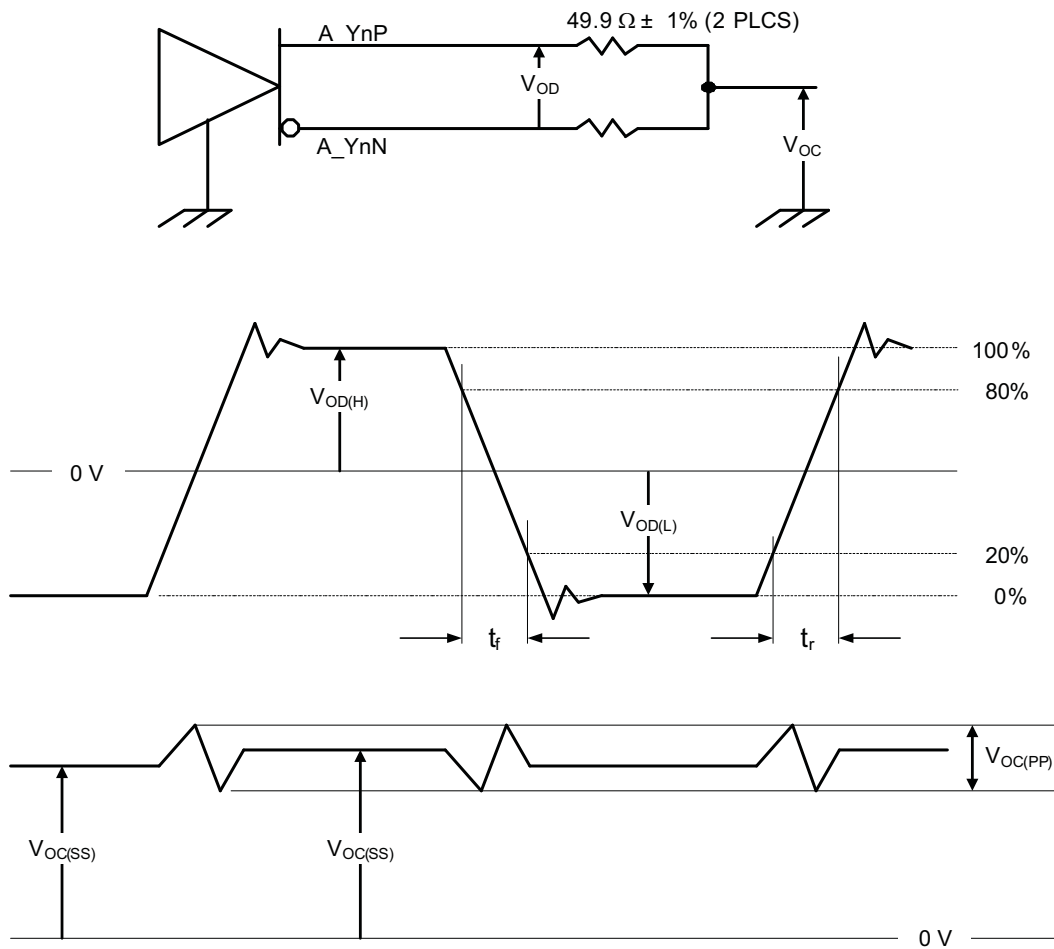

Figure 3. Test Load and Voltage Definitions for FlatLink Outputs

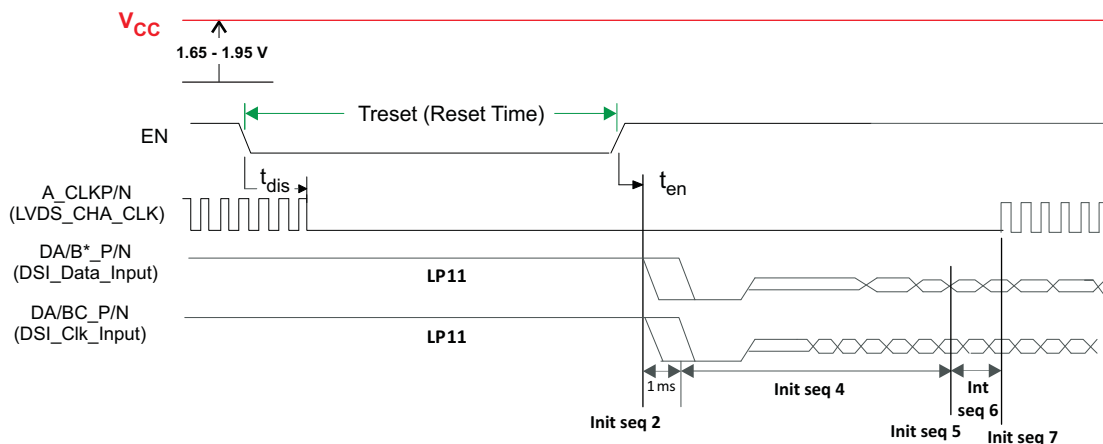

Figure 4. SN65DSI83 FlatLink Timing Definitions

- The Initialization sequence can be found in [Recommended Initialization Setup Sequence](#). The *Init seq** corresponds to the sequence number in [Recommended Initialization Setup Sequence](#).
- A_CLKP/N (LVDS_CHA_CLK) and CHA LVDS data lanes 0-2 output valid CLK and data after internal PLL locks (minimum of 3 ms after PLL_EN at address offset 0x0D is set). Other LVDS CLK/data lanes stay low until they are configured to be enabled in corresponding CSRs. CLK source (REF_CLK or DSI HS CLK) must be at a valid frequency as programmed in CSR for the PLL to lock correctly. Refer to [Clock Configurations and Multipliers](#).
- The LP11 to HS transition to the data lanes and the CLK lane must be done per the timing requirements specified in the MIPI D-PHY Specification.

Figure 5. Shutdown and RESET Timing Definition While V_{CC} is High

- See [ULPS](#) for the ULPS entry and exit sequence.
- ULPS entry and exit protocol and timing requirements must be met per MIPI DPHY specification.

Figure 6. ULPS Timing Definition

7.3 Feature Description

7.3.1 Clock Configurations and Multipliers

The FlatLink LVDS clock may be derived from the DSI channel A clock, or from an external reference clock source. When the MIPI D-PHY channel A HS clock is used as the LVDS clock source, the D-PHY clock lane must operate in HS free-running (continuous) mode. This feature eliminates the need for an external reference clock reducing system costs

The reference clock source is selected by HS_CLK_SRC (CSR 0x0A.0) programmed through the local I²C interface. If an external reference clock is selected, it is multiplied by the factor in REFCLK_MULTIPLIER (CSR 0x0B.1:0) to generate the FlatLink LVDS output clock. When an external reference clock is selected, it must be between 25 MHz and 154 MHz. If the DSI channel A clock is selected, it is divided by the factor in DSI_CLK_DIVIDER (CSR 0x0B.7:3) to generate the FlatLink LVDS output clock. Additionally, LVDS_CLK_RANGE (CSR 0x0A.3:1) and CH_DSI_CLK_RANGE(CSR 0x12) must be set to the frequency range of the FlatLink LVDS output clock and DSI Channel A input clock respectively for the internal PLL to operate correctly. After these settings are programmed, PLL_EN (CSR 0x0D.0) must be set to enable the internal PLL.

7.3.2 ULPS

The SN65DSI83 device supports the MIPI defined ULPS. While the device is in the ULPS, the CSR registers are accessible via I²C interface. ULPS sequence must be issued to all active DSI CLK and, or DSI data lanes of the enabled DSI channels for the SN65DSI83 device to enter the ULPS. The following sequence must be followed to enter and exit the ULPS.

1. The host issues a ULPS entry sequence to all DSI CLK and data lanes enabled.
2. When the host is ready to exit the ULPS mode, the host issues a ULPS exit sequence to all DSI CLK and data lanes that need to be active in normal operation.
3. Wait for the PLL_LOCK bit (CSR 0x0A.7) to be set.
4. Set the SOFT_RESET bit (CSR 0x09.0).
5. Device resumes normal operation (that is, video streaming resumes on the panel).

7.3.3 LVDS Pattern Generation

The SN65DSI83 device supports a pattern generation feature on LVDS channels. This feature can be used to test the LVDS output path and LVDS panels in a system platform. The pattern generation feature can be enabled by setting the CHA_TEST_PATTERN bit at address 0x3C. No DSI data is received while the pattern generation feature is enabled.

There are three modes available for LVDS test pattern generation. The mode of test pattern generation is determined by register configuration, as shown in [Table 1](#).

Table 1. Video Registers

ADDRESS BIT	REGISTER NAME
0x20.7:0	CHA_ACTIVE_LINE_LENGTH_LOW
0x21.3:0	CHA_ACTIVE_LINE_LENGTH_HIGH
0x24.7:0	CHA_VERTICAL_DISPLAY_SIZE_LOW
0x25.3:0	CHA_VERTICAL_DISPLAY_SIZE_HIGH
0x2C.7:0	CHA_HSYNC_PULSE_WIDTH_LOW
0x2D.1:0	CHA_HSYNC_PULSE_WIDTH_HIGH
0x30.7:0	CHA_VSYNC_PULSE_WIDTH_LOW
0x31.1:0	CHA_VSYNC_PULSE_WIDTH_HIGH
0x34.7:0	CHA_HORIZONTAL_BACK_PORCH
0x36.7:0	CHA_VERTICAL_BACK_PORCH
0x38.7:0	CHA_HORIZONTAL_FRONT_PORCH
0x3A.7:0	CHA_VERTICAL_FRONT_PORCH

7.4 Device Functional Modes

7.4.1 Reset Implementation

When EN is deasserted (low), the SN65DSI83 device is in shutdown or reset state. In this state, CMOS inputs are ignored, the MIPI D-PHY inputs are disabled and outputs are high impedance. It is critical to transition the EN input from a low level to a high level after the V_{CC} supply has reached the minimum operating voltage, as shown in Figure 7. This is achieved by a control signal to the EN input, or by an external capacitor connected between EN and GND.

Figure 7. Cold Start V_{CC} Ramp up to EN

When implementing the external capacitor, the size of the external capacitor depends on the power-up ramp of the V_{CC} supply, where a slower ramp-up results in a larger value external capacitor. See the latest reference schematic for the SN65DSI83 device and, or consider approximately 200-nF capacitor as a reasonable first estimate for the size of the external capacitor.

Both EN implementations are shown in Figure 8 and Figure 9.

Figure 8. External Capacitor Controlled EN

Figure 9. EN Input from Active Controller

When the SN65DSI83 device is reset while V_{CC} is high, the EN pin must be held low for at least 10 ms before being asserted high, as shown in Figure 5 to be sure that the device is properly reset. The DSI lanes including the CLK lanes must be driven to LP11 while the device is in reset until the EN pin is asserted high per the timing shown in Figure 5.

Device Functional Modes (continued)

7.4.2 Recommended Initialization Setup Sequence

TI recommends to use the following initialization sequence for the SN65DSI83 device (also see [Figure 7](#)).

Table 2. Initialization Sequence

INITIALIZATION SEQUENCE NUMBER	INITIALIZATION SEQUENCE DESCRIPTION
Init seq1	After power is applied and stable, all DSI input lanes including DSI CLK(DA x P/N, DB x P/N) must be driven to LP11 state.
Init seq2	Assert the EN pin
Init seq3	Wait for 1 ms for the internal voltage regulator to stabilize
Init seq4	Initialize all CSR registers to their appropriate values based on the implementation. (The SN65DSI83 device is not functional until the CSR registers are initialized.)
Init seq5	Start the DSI video stream
Init seq6	Set the PLL_EN bit(CSR 0x0D.0)
Init seq7	Wait for a minimum of 3 ms
Init seq8	Set the SOFT_RESET bit (CSR 0x09.0)

7.4.3 LVDS Output Formats

The SN65DSI83 device processes DSI packets and produces video data driven to the FlatLink LVDS interface in an industry standard format. Single-Link LVDS is supported by the SN65DSI83 device. During conditions such as the default condition, and some video synchronization periods, where no video stream data is passing from the DSI input to the LVDS output, the SN65DSI83 device transmits zero value pixel data on the LVDS outputs while maintaining transmission of the vertical sync and horizontal sync status.

[Figure 10](#) illustrates a Single-Link LVDS 18 bpp application.

[Figure 11](#) illustrates a Single-Link 24 bpp application using Format 2, controlled by CHA_24BPP_FORMAT1 (CSR 0x18.1). In data Format 2, the two MSB per color are transferred on the Y3P/N LVDS lane.

[Figure 12](#) illustrates a 24 bpp Single-Link application using Format 1. In data Format 1, the two LSB per color are transferred on the Y3P/N LVDS lane.

[Figure 13](#) illustrates a Single-Link LVDS application where 24 bpp data is received from DSI and converted to 18 bpp data for transmission to an 18 bpp panel. This application is configured by setting CHA_24BPP_FORMAT1 (CSR 0x18.1) to 1 and CHA_24BPP_MODE (CSR 0x18.3) to 0. In this configuration, the SN65DSI83 device does not transmit the 2 LSB per color since the Y3P and Y3N LVDS lane is disabled.

NOTE

[Figure 10](#), [Figure 11](#), [Figure 12](#), and [Figure 13](#) only illustrate a few example applications for the SN65DSI83 device. Other applications are also supported.

DE = Data Enable; A_Y3P/N are Output Low

Figure 10. FlatLink Output Data; Single-Link 18 bpp

DE = Data Enable; A_Y3P and A_Y3N are output low; A_Y3P and A_Y3N are output low

Figure 13. FlatLink Output Data (Format 1); 24 bpp to Single-Link 18 bpp Conversion

7.4.4 DSI Lane Merging

The SN65DSI83 device supports four DSI data lanes, and may be configured to support 1, 2, or 3 DSI data lanes per channel. Unused DSI input pins on the SN65DSI83 device must be left unconnected or driven to LP11 state. The bytes received from the data lanes are merged in HS mode to form packets that carry the video stream. DSI data lanes are bit and byte aligned.

Figure 14 shows the lane merging function for each channel; 4-, 3-, and 2-lane modes.

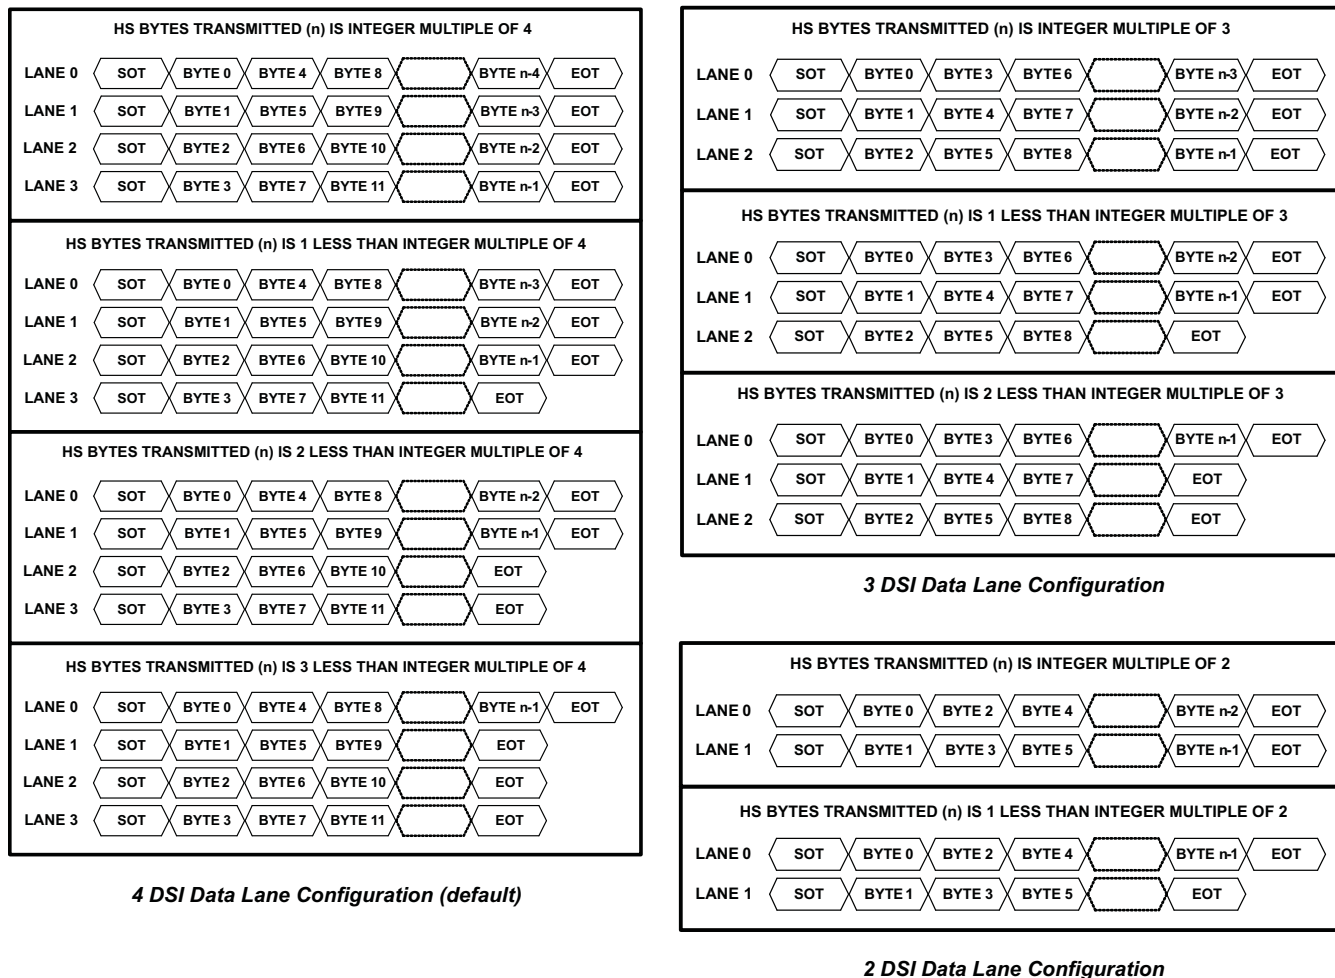

Figure 14. SN65DSI83 DSI Lane Merging Illustration

7.4.5 DSI Pixel Stream Packets

The SN65DSI83 device processes 18 bpp (RGB666) and 24 bpp (RGB888) DSI packets on each channel, as shown in Figure 15, Figure 16, and Figure 17.

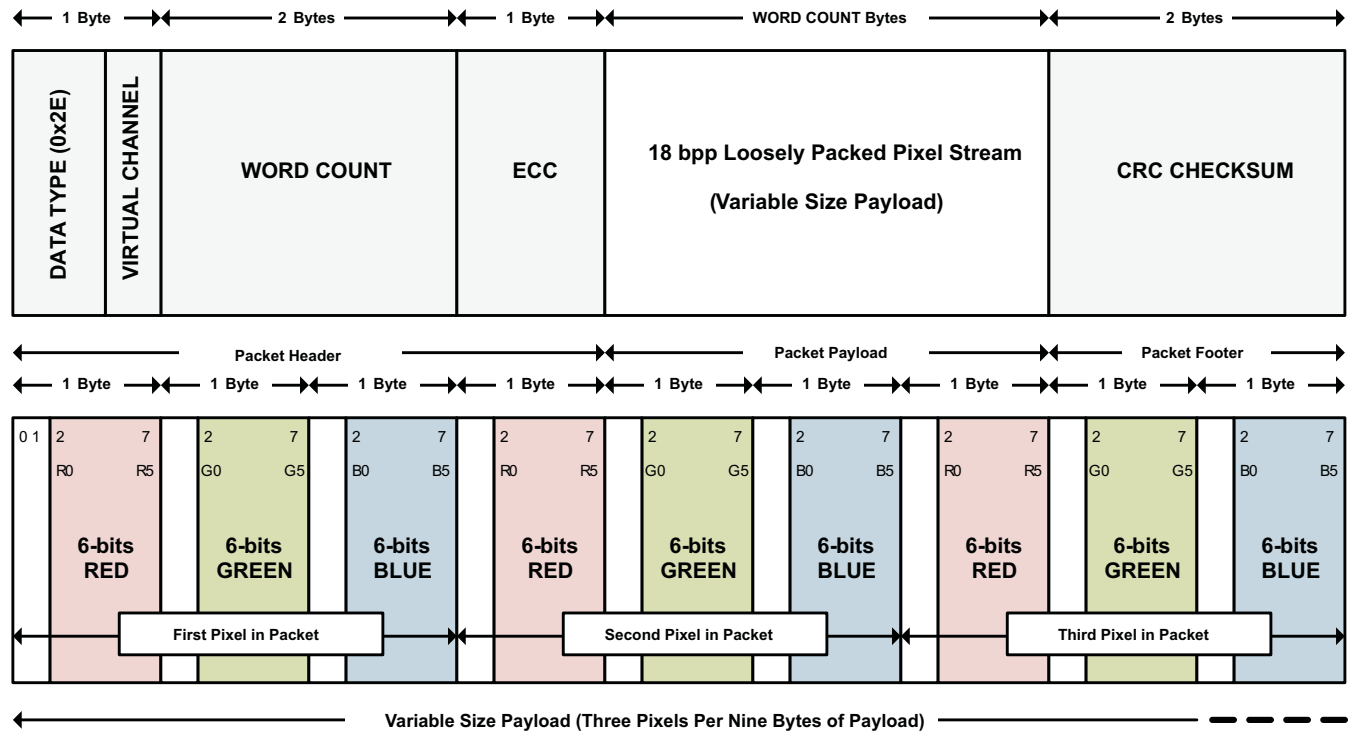

Figure 15. 18 bpp (Loosely Packed) DSI Packet Structure

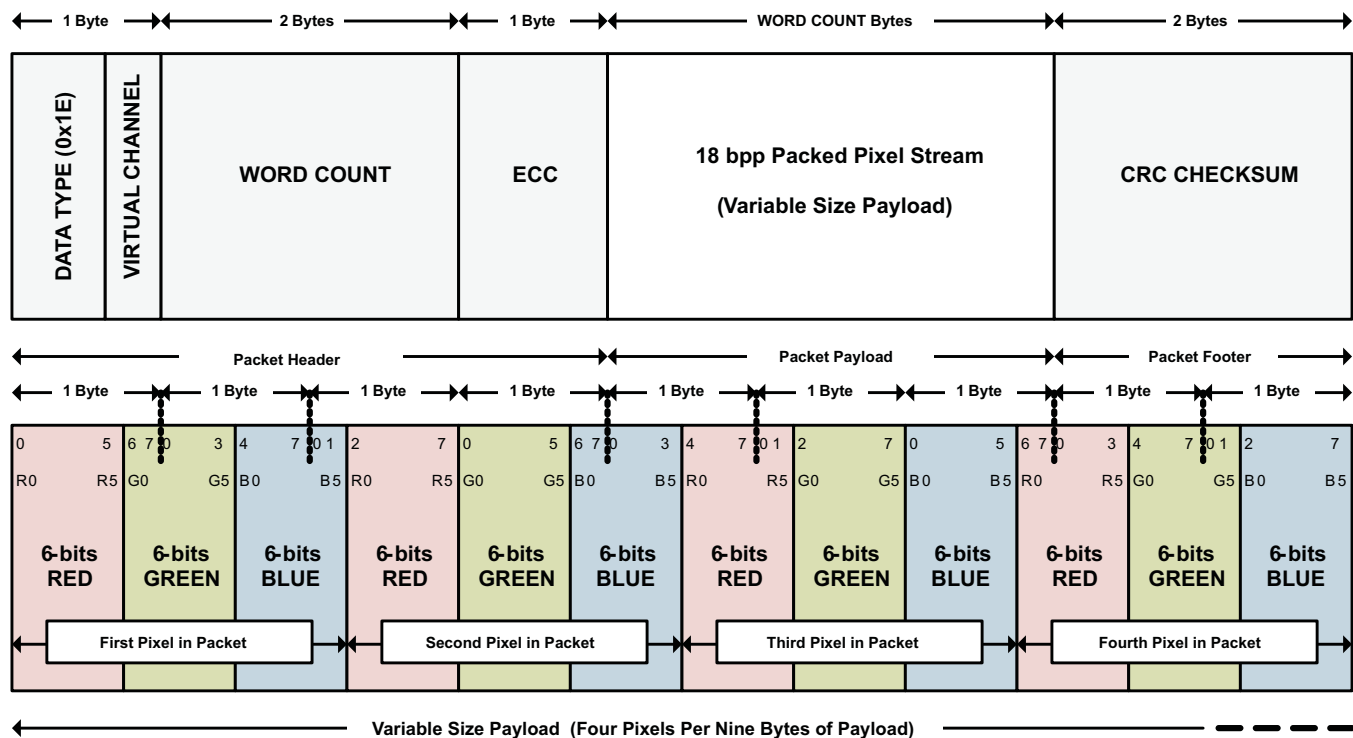

Figure 16. 18 bpp (Tightly Packed) DSI Packet Structure

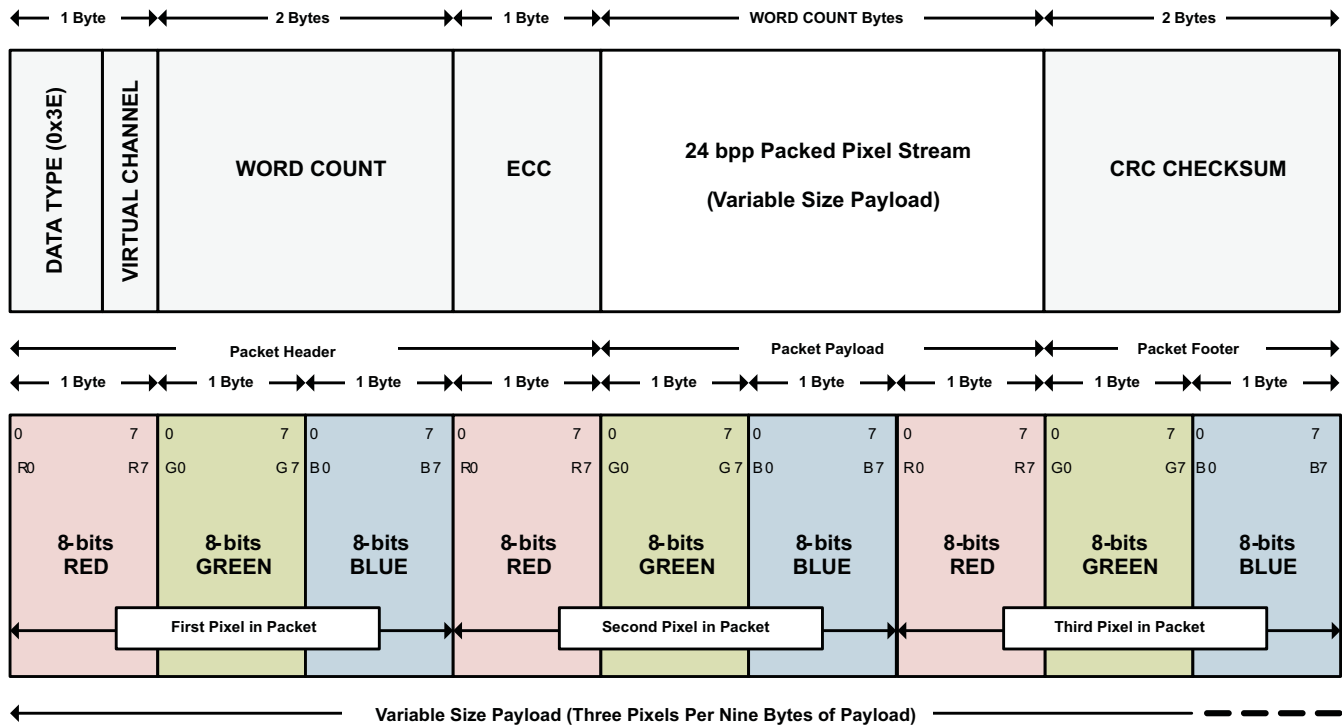

Figure 17. 24 bpp DSI Packet Structure

7.4.6 DSI Video Transmission Specifications

The SN65DSI83 device supports burst video mode and non-burst video mode with sync events or with sync pulses packet transmission as described in the DSI specification. The burst mode supports time-compressed pixel stream packets that leave added time per scan line for power savings LP mode. The SN65DSI83 device requires a transition to LP mode once per frame to enable PHY synchronization with the DSI host processor; however, for a robust and low-power implementation, the transition to LP mode is recommended on every video line.

Figure 18 shows the DSI video transmission applied to SN65DSI83 device applications. In all applications, the LVDS output rate must be less than or equal to the DSI input rate. The first line of a video frame shall start with a VSS packet, and all other lines start with VSE or HSS. The position of the synchronization packets in time is of utmost importance since this has a direct impact on the visual performance of the display panel; that is, these packets generate the HS and VS (horizontal and vertical sync) signals on the LVDS interface after the delay programmed into CHA_SYNC_DELAY_LOW/HIGH (CSR 0x28.7:0 and 0x29.3:0).

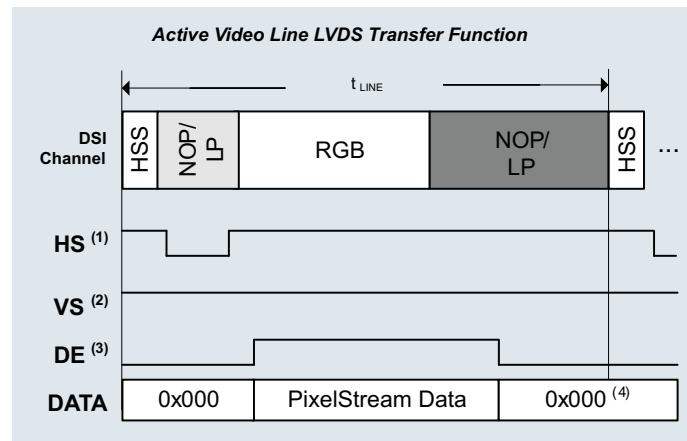

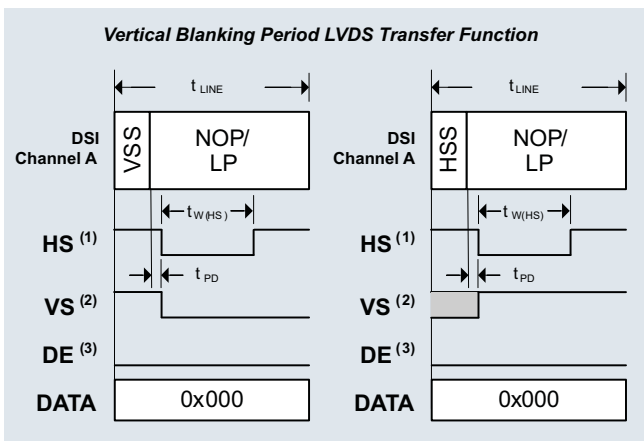

As required in the DSI specification, the SN65DSI83 device requires that pixel stream packets contain an integer number of pixels (that is, end on a pixel boundary); TI recommends to transmit an entire scan line on one pixel stream packet. When a scan line is broken in to multiple packets, inter-packet latency shall be considered such that the video pipeline (that is, pixel queue or partial line buffer) does not run empty (under-run); during scan line processing, if the pixel queue runs empty, the SN65DSI83 device transmits zero data (18'b0 or 24'b0) on the LVDS interface.

NOTE

When the HS clock is used as a source for the LVDS pixel clock, the LP mode transitions apply only to the data lanes, and the DSI clock lane remains in the HS mode during the entire video transmission.

NOTE

The SN65DSI83 device does not support the DSI virtual channel capability or reverse direction (peripheral to processor) transmissions.

- (1) The assertion of HS is delayed (t_{PD}) by a programmable number of pixel clocks from the last bit of VSS/HSS packet received on DSI. The HS pulse width ($t_{W(HS)}$) is also programmable. The illustration shows HS active low.
- (2) VS is signaled for a programmable number of lines (t_{LINE}) and is asserted when HS is asserted for the first line of the frame. VS is de-asserted when HS is asserted after the number of lines programmed has been reached. The illustration shows VS active low
- (3) DE is asserted when active pixel data is transmitted on LVDS, and polarity is set independent to HS/VS. The illustration shows DE active high
- (4) After the last pixel in an active line is output to LVDS, the LVDS data is output zero

NOP/LP	DSI Null Packet, Blanking Packet, or a transition to LP Mode

Figure 18. DSI Channel Transmission and Transfer Function

7.5 Programming

7.5.1 Local I²C Interface Overview

The SN65DSI83 device local I²C interface is enabled when EN is input high, access to the CSR registers is supported during ULPS. The SCL and SDA pins are used for I²C clock and I²C data respectively. The SN65DSI83 device I²C interface conforms to the 2-wire serial interface defined by the I²C Bus Specification, Version 2.1 (January 2000) and supports fast mode transfers up to 400 kbps.

The device address byte is the first byte received following the start condition from the master device. The 7-bit device address for SN65DSI83 device is factory preset to 010110X with the least significant bit being determined by the ADDR control input. Table 3 clarifies the SN65DSI83 device target address.

Programming (continued)

Table 3. SN65DSI83 I²C Target Address Description ⁽¹⁾⁽²⁾

BIT 7 (MSB)	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0 (W/R)
0	1	0	1	1	0	ADDR	0/1

(1) When ADDR = 1, Address cycle is 0x5A (write) and 0x5B (read)

(2) When ADDR = 0, Address cycle is 0x58 (write) and 0x59 (read)

The following procedure is followed to write to the SN65DSI83 device I²C registers:

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI83 device 7-bit address and a zero-value W/R bit to indicate a write cycle.
2. The SN65DSI83 device acknowledges the address cycle.
3. The master presents the subaddress (I²C register within SN65DSI83 device) to be written, consisting of one byte of data, MSB-first.
4. The SN65DSI83 device acknowledges the subaddress cycle.
5. The master presents the first byte of data to be written to the I²C register.
6. The SN65DSI83 device acknowledges the byte transfer.
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the SN65DSI83 device.
8. The master terminates the write operation by generating a stop condition (P).

The following procedure is followed to read the SN65DSI83 I²C registers:

1. The master initiates a read operation by generating a start condition (S), followed by the SN65DSI83 device 7-bit address and a one-value W/R bit to indicate a read cycle.
2. The SN65DSI83 device acknowledges the address cycle.
3. The SN65DSI83 device transmits the contents of the memory registers MSB-first starting at register 00h. If a write to the SN65DSI83 I²C register occurred prior to the read, then the SN65DSI83 device starts at the subaddress specified in the write.
4. The SN65DSI83 device waits for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I²C master acknowledges reception of each data byte transfer.
5. If an ACK is received, the SN65DSI83 device transmits the next byte of data.
6. The master terminates the read operation by generating a stop condition (P).

The following procedure is followed for setting a starting subaddress for I²C reads:

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI83 device 7-bit address and a zero-value W/R bit to indicate a write cycle
2. The SN65DSI83 device acknowledges the address cycle.
3. The master presents the subaddress (I²C register within the SN65DSI83 device) to be written, consisting of one byte of data, MSB first.
4. The SN65DSI83 device acknowledges the subaddress cycle.
5. The master terminates the write operation by generating a stop condition (P).

7.6 Register Maps

7.6.1 Control and Status Registers Overview

Many of the SN65DSI83 device functions are controlled by the control and status registers (CSR). All CSR registers are accessible through the local I²C interface.

See [Table 4](#) through [Table 9](#) for the SN65DSI83 CSR descriptions. Reserved or undefined bit fields must not be modified. Otherwise, the device may operate incorrectly.

Table 4. CSR Bit Field Definitions – ID Registers

ADDRESS	BIT	DESCRIPTION	DEFAULT	ACCESS ⁽¹⁾
0x00 – 0x08	7:0	Reserved Addresses 0x08 – 0x00 = {0x01, 0x20, 0x20, 0x20, 0x44, 0x53, 0x49, 0x38, 0x35}	Reserved	R/O

(1) R/O = Read only; R/W = Read/write; R/W1C = Read/write 1 to clear; W/O = Write only (reads return undetermined values)

Table 5. CSR Bit Field Definitions – Reset and Clock Registers

ADDRESS	BIT	DESCRIPTION	DEFAULT	ACCESS ⁽¹⁾
0x09	0	SOFT_RESET This bit automatically clears when set to 1 and returns 0s when read. This bit must be set after the CSR's are updated. This bit must also be set after making any changes to the DIS clock rate or after changing between DSI burst and nonburst modes. 0 – No action (default) 1 – Reset device to default condition excluding the CSR bits	0	W/O
0x0A	7	PLL_EN_STAT After PLL_EN_STAT = 1, wait at least 3 ms for PLL to lock 0 – PLL not enabled (default) 1 – PLL enabled	0	R/O
	3:1	LVDS_CLK_RANGE This field selects the frequency range of the LVDS output clock. 000 – 25 MHz ≤ LVDS_CLK < 37.5 MHz 001 – 37.5 MHz ≤ LVDS_CLK < 62.5 MHz 010 – 62.5 MHz ≤ LVDS_CLK < 87.5 MHz 011 – 87.5 MHz ≤ LVDS_CLK < 112.5 MHz 100 – 112.5 MHz ≤ LVDS_CLK < 137.5 MHz 101 – 137.5 MHz ≤ LVDS_CLK ≤ 154 MHz (default) 110 – Reserved 111 – Reserved	101	R/W
	0	HS_CLK_SRC 0 – LVDS pixel clock derived from input REFCLK (default) 1 – LVDS pixel clock derived from MIPI D-PHY channel A HS continuous clock	0	R/W
0x0B	7:3	DSI_CLK_DIVIDER When CSR 0x0A.0 = 1, this field controls the divider used to generate the LVDS output clock from the MIPI D-PHY Channel A HS continuous clock. When CSR 0x0A.0 = 0, this field must be programmed to 00000. 00000 – LVDS clock = source clock (default) 00001 – Divide by 2 00010 – Divide by 3 00011 – Divide by 4 ... 10111 – Divide by 24 11000 – Divide by 25 11001 through 11111 – Reserved	00000	R/W
	1:0	REFCLK_MULTIPLIER When CSR 0x0A.0 = 0, this field controls the multiplier used to generate the LVDS output clock from the input REFCLK. When CSR 0x0A.0 = 1, this field must be programmed to 00. 00 – LVDS clock = source clock (default) 01 – Multiply by 2 10 – Multiply by 3 11 – Multiply by 4	00	R/W

(1) R/O = Read Only; R/W = Read/write; R/W1C = Read/write 1 to Clear; W/O = Write only (reads return undetermined values)

Table 5. CSR Bit Field Definitions – Reset and Clock Registers (continued)

ADDRESS	BIT	DESCRIPTION	DEFAULT	ACCESS ⁽¹⁾
0x0D	0	PLL_EN When this bit is set, the PLL is enabled with the settings programmed into CSR 0x0A and CSR 0x0B. The PLL must be disabled before changing any of the settings in CSR 0x0A and CSR 0x0B. The input clock source must be active and stable before the PLL is enabled. 0 – PLL disabled (default) 1 – PLL enabled	0	R/W

Table 6. CSR Bit Field Definitions – DSI Registers

ADDRESS	BIT	DESCRIPTION	DEFAULT	ACCESS ⁽¹⁾
0x10	7	Reserved. Do not write to this field. Must remain at default.	0	R/W
	6:5	Reserved. Do not write to this field. Must remain at default.	01	R/W
	4:3	CHA_DSI_LANES This field controls the number of lanes that are enabled for DSI channel A. 00 – Four lanes are enabled 01 – Three lanes are enabled 10 – Two lanes are enabled 11 – One lane is enabled (default) Note: Unused DSI input pins on the SN65DSI83 must be left unconnected.	11	R/W
	0	SOT_ERR_TOL_DIS 0 – Single bit errors are tolerated for the start of transaction SoT leader sequence (default) 1 – No SoT bit errors are tolerated	0	R/W
0x11	7:6	CHA_DSI_DATA_EQ This field controls the equalization for the DSI channel A data lanes 00 – No equalization (default) 01 – 1 dB equalization 10 – Reserved 11 – 2 dB equalization	00	R/W
	3:2	CHA_DSI_CLK_EQ This field controls the equalization for the DSI channel A clock 00 – No equalization (default) 01 – 1-dB equalization 10 – Reserved 11 – 2-dB equalization	00	R/W
0x12	7:0	CHA_DSI_CLK_RANGE This field specifies the DSI clock frequency range in 5-MHz increments for the DSI channel A clock 0x00 through 0x07 – Reserved 0x08 – 40 ≤ frequency < 45 MHz 0x09 – 45 ≤ frequency < 50 MHz ... 0x63 – 495 ≤ frequency < 500 MHz 0x64 – 500 MHz 0x65 through 0xFF – Reserved	0	R/W

(1) R/O = Read only; R/W = Read/write; R/W1C = Read/write 1 to clear; W/O = Write only (reads return undetermined values)

Table 7. CSR Bit Field Definitions – LVDS Registers

ADDRESS	BIT	DESCRIPTION	DEFAULT	ACCESS ⁽¹⁾
0x18	7	DE_NEG_POLARITY 0 – DE is positive polarity driven 1 during active pixel transmission on LVDS (default) 1 – DE is negative polarity driven 0 during active pixel transmission on LVDS	0	R/W
	6	HS_NEG_POLARITY 0 – HS is positive polarity driven 1 during corresponding sync conditions 1 – HS is negative polarity driven 0 during corresponding sync (default)	1	R/W
	5	VS_NEG_POLARITY 0 – VS is positive polarity driven 1 during corresponding sync conditions 1 – VS is negative polarity driven 0 during corresponding sync (default)	1	R/W
	4	Reserved. Do not write to this field. Must remain at default.	1	R/W
	3	CHA_24BPP_MODE 0 – Force 18 bpp; LVDS channel A lane 4 (A_Y3P or A_Y3N) is disabled (default) 1 – Force 24 bpp; LVDS channel A lane 4 (A_Y3P or A_Y3N) is enabled	0	R/W
	1	CHA_24BPP_FORMAT1 This field selects the 24 bpp data format 0 – LVDS channel A lane A_Y3P or A_Y3N transmits the 2 MSB per color; format 2 (default) 1 – LVDS channel A lane A_Y3P or A_Y3N transmits the 2 LSB per color; format 1 Note1: This field must be 0 when 18bpp data is received from DSI. Note2: If this field is set to 1 and CHA_24BPP_MODE is 0, the SN65DSI83 device will convert 24-bpp data to 18-bpp data for transmission to an 18-bpp panel. In this configuration, the SN65DSI83 device will not transmit the 2 LSB per color on LVDS channel A, since LVDS channel A lane 4 is disabled.	0	R/W
0x19	6	CHA_LVDS_VOVM This field controls the common mode output voltage for LVDS channel A 0 – 1.2 V (default) 1 – 0.9 V (CSR 0x1B.5:4 CHA_LVDS_CM_ADJUST must be set to 01b)	0	R/W
	3:2	CHA_LVDS_VOD_SWING This field controls the differential output voltage for LVDS channel A. See the Electrical Characteristics table for V _{OD} for each setting: 00, 01 (default), 10, 11	01	R/W
0x1A	5	CHA_REVERSE_LVDS This bit controls the order of the LVDS pins for channel A. 0 – Normal LVDS channel A pin order. LVDS channel A pin order is the same as listed in the Pin Assignments Section. (default) 1 – Reversed LVDS channel A pin order. LVDS channel A pin order is remapped as follows: <ul style="list-style-type: none"> • A_Y0P → A_Y3P • A_Y0N → A_Y3N • A_Y1P → A_CLKP • A_Y1N → A_CLKN • A_Y2P → A_Y2P • A_Y2N → A_Y2N • A_CLKP → A_Y1P • A_CLKN → A_Y1N • A_Y3P → A_Y0P • A_Y3N → A_Y0N 	0	R/W
	1	CHA_LVDS_TERM This bit controls the near end differential termination for LVDS channel A. This bit also affects the output voltage for LVDS Channel A. 0 – 100-Ω differential termination 1 – 200-Ω differential termination (default)	1	R/W

(1) R/O = Read only; R/W = Read/write; R/W1C = Read/write 1 to clear; W/O = Write only (reads return undetermined values)

Table 7. CSR Bit Field Definitions – LVDS Registers (continued)

ADDRESS	BIT	DESCRIPTION	DEFAULT	ACCESS ⁽¹⁾
0x1B	5:4	CHA_LVDS_CM_ADJUST This field can be used to adjust the common mode output voltage for LVDS channel A. 00 – No change to common mode voltage (default) 01 – Adjust common mode voltage down 3% 10 – Adjust common mode voltage up 3% 11 – Adjust common mode voltage up 6%	00	R/W

NOTE

For all video registers:

TEST PATTERN GENERATION PURPOSE ONLY registers are for test pattern generation use only. Others are for normal operation unless the test pattern generation feature is enabled.

Table 8. CSR Bit Field Definitions – Video Registers

ADDRESS	BIT	DESCRIPTION	DEFAULT	ACCESS ⁽¹⁾
0x20	7:0	CHA_ACTIVE_LINE_LENGTH_LOW This field controls the length in pixels of the active horizontal line that are received on DSI channel A and output to LVDS channel A.. The value in this field is the lower 8 bits of the 12-bit value for the horizontal line length.	0	R/W
0x21	3:0	CHA_ACTIVE_LINE_LENGTH_HIGH This field controls the length in pixels of the active horizontal line that are received on DSI channel A and output to LVDS channel A.. The value in this field is the upper 4 bits of the 12-bit value for the horizontal line length.	0	R/W
0x24	7:0	CHA_VERTICAL_DISPLAY_SIZE_LOW TEST PATTERN GENERATION PURPOSE ONLY. This field controls the vertical display size in lines for LVDS channel A. The value in this field is the lower 8 bits of the 12-bit value for the vertical display size. The value in this field is only used for channel A test pattern generation.	0	R/W
0x25	3:0	CHA_VERTICAL_DISPLAY_SIZE_HIGH TEST PATTERN GENERATION PURPOSE ONLY. This field controls the vertical display size in lines for LVDS channel A. The value in this field is the upper 4 bits of the 12-bit value for the vertical display size. The value in this field is only used for channel A test pattern generation.	0	R/W
0x28	7:0	CHA_SYNC_DELAY_LOW This field controls the delay in pixel clocks from when an HSync or VSync is received on the DSI to when it is transmitted on the LVDS interface for channel A. The delay specified by this field is in addition to the pipeline and synchronization delays in the SN65DSI83 device. The additional delay is approximately 10 pixel clocks. The sync delay must be programmed to at least 32 pixel clocks to ensure proper operation. The value in this field is the lower 8 bits of the 12-bit value for the sync delay.	0	R/W
0x29	3:0	CHA_SYNC_DELAY_HIGH This field controls the delay in pixel clocks from when an HSync or VSync is received on the DSI to when it is transmitted on the LVDS interface for channel A. The delay specified by this field is in addition to the pipeline and synchronization delays in the SN65DSI83 device. The additional delay is approximately 10 pixel clocks. The sync delay must be programmed to at least 32 pixel clocks to ensure proper operation. The value in this field is the lower 4 bits of the 12-bit value for the sync delay.	0	R/W
0x2C	7:0	CHA_HSYNC_PULSE_WIDTH_LOW This field controls the width in pixel clocks of the HSync pulse duration for LVDS channel A. The value in this field is the lower 8 bits of the 10-bit value for the HSync pulse duration. The value in this field is used for channel A test pattern generation when test pattern generation feature is enabled by programming bit 4 at 0x3C.	0	R/W

(1) R/O = Read only; R/W = Read/write; R/W1C = Read/write 1 to clear; W/O = Write only (reads return undetermined values)

Table 8. CSR Bit Field Definitions – Video Registers (continued)

ADDRESS	BIT	DESCRIPTION	DEFAULT	ACCESS ⁽¹⁾
0x2D	1:0	CHA_HSYNC_PULSE_WIDTH_HIGH This field controls the width in pixel clocks of the HSync pulse duration for LVDS channel A. The value in this field is the upper 2 bits of the 10-bit value for the HSync pulse duration. The value in this field is used for channel A test pattern generation when test pattern generation feature is enabled by programming bit 4 at 0x3C.	0	R/W
0x30	7:0	CHA_VSYNC_PULSE_WIDTH_LOW This field controls the length in lines of the VSync pulse duration for LVDS channel A. The value in this field is the lower 8 bits of the 10-bit value for the VSync pulse duration. The value in this field is used for channel A test pattern generation when test pattern generation feature is enabled by programming bit 4 at 0x3C.	0	R/W
0x31	1:0	CHA_VSYNC_PULSE_WIDTH_HIGH This field controls the length in lines of the VSync pulse duration for LVDS channel A. The value in this field is the upper 2 bits of the 10-bit value for the VSync pulse duration. The value in this field is used for channel A test pattern generation when test pattern generation feature is enabled by programming bit 4 at 0x3C.	0	R/W
0x34	7:0	CHA_HORIZONTAL_BACK_PORCH This field controls the time in pixel clocks between the end of the HSync pulse and the start of the active video data for LVDS channel A. The value in this field is used for channel A test pattern generation when test pattern generation feature is enabled by programming bit 4 at 0x3C.	0	R/W
0x36	7:0	CHA_VERTICAL_BACK_PORCH TEST PATTERN GENERATION PURPOSE ONLY. This field controls the number of lines between the end of the VSync pulse and the start of the active video data for LVDS channel A. The value in this field is only used for channel A test pattern generation.	0	R/W
0x38	7:0	CHA_HORIZONTAL_FRONT_PORCH TEST PATTERN GENERATION PURPOSE ONLY. This field controls the time in pixel clocks between the end of the active video data and the start of the HSync pulse for LVDS channel A. The value in this field is only used for channel A test pattern generation.	0	R/W
0x3A	7:0	CHA_VERTICAL_FRONT_PORCH TEST PATTERN GENERATION PURPOSE ONLY. This field controls the number of lines between the end of the active video data and the start of the VSync pulse for LVDS channel A. The value in this field is only used for channel A test pattern generation.	0	R/W
0x3C	4	CHA_TEST_PATTERN TEST PATTERN GENERATION PURPOSE ONLY. When this bit is set, the SN65DSI83 device will generate a video test pattern for LVDS channel A based on the values programmed into the video registers for channel A.	0	R/W

Table 9. CSR Bit Field Definitions – IRQ Registers

ADDRESS	BIT	DESCRIPTION	DEFAULT	ACCESS ⁽¹⁾
0xE0	0	IRQ_EN When enabled by this field, the IRQ output is driven high to communicate IRQ events. 0 – IRQ output is high-impedance (default) 1 – IRQ output is driven high when a bit is set in registers 0xE5 that also has the corresponding IRQ_EN bit set to enable the interrupt condition	0	R/W
0xE1	7	CHA_SYNCH_ERR_EN 0 – CHA_SYNCH_ERR is masked 1 – CHA_SYNCH_ERR is enabled to generate IRQ events	0	R/W

	5	CHA_UNC_ECC_ERR_EN 0 – CHA_UNC_ECC_ERR is masked 1 – CHA_UNC_ECC_ERR is enabled to generate IRQ events	0	R/W
	4	CHA_COR_ECC_ERR_EN 0 – CHA_COR_ECC_ERR is masked 1 – CHA_COR_ECC_ERR is enabled to generate IRQ events	0	R/W
	3	CHA_LL_P_ERR_EN 0 – CHA_LL_P_ERR is masked 1 – CHA_LL_P_ERR is enabled to generate IRQ events	0	R/W
	2	CHA_SOT_BIT_ERR_EN 0 – CHA_SOT_BIT_ERR is masked 1 – CHA_SOT_BIT_ERR is enabled to generate IRQ events	0	R/W
	0	PLL_UNLOCK_EN 0 – PLL_UNLOCK is masked 1 – PLL_UNLOCK is enabled to generate IRQ events	0	R/W
0xE5	7	CHA_SYNCH_ERR When the DSI channel A packet processor detects an HS or VS synchronization error, that is, an unexpected sync packet; this bit is set; this bit is cleared by writing a 1 value.	0	R/W1C
	6	CHA_CRC_ERR When the DSI channel A packet processor detects a data stream CRC error, this bit is set; this bit is cleared by writing a 1 value.	0	R/W1C
	5	CHA_UNC_ECC_ERR When the DSI channel A packet processor detects an uncorrectable ECC error, this bit is set; this bit is cleared by writing a 1 value.	0	R/W1C
	4	CHA_COR_ECC_ERR When the DSI channel A packet processor detects a correctable ECC error, this bit is set; this bit is cleared by writing a 1 value.	0	R/W1C
	3	CHA_LL_P_ERR When the DSI channel A packet processor detects a low level protocol error, this bit is set; this bit is cleared by writing a 1 value. Low-level protocol errors include SoT and EoT sync errors, Escape Mode entry command errors, LP transmission sync errors, and false control errors. Lane merge errors are reported by this status condition.	0	R/W1C
	2	CHA_SOT_BIT_ERR When the DSI channel A packet processor detects an SoT leader sequence bit error, this bit is set; this bit is cleared by writing a 1 value.	0	R/W1C
	0	PLL_UNLOCK This bit is set whenever the PLL Lock status transitions from LOCK to UNLOCK.	1	R/W1C

(1) R/O = Read only; R/W = Read/write; R/W1C = Read/write 1 to clear; W/O = Write only (reads return undetermined values)

8 Applications and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The SN65DSI83 device is primarily targeted for portable applications such as tablets and smart phones that utilize the MIPI DSI video format. The SN65DSI83 device can be used between a GPU with DSI output and a video panel with LVDS inputs.

8.1.1 Video STOP and Restart Sequence

When the system requires to stop outputting video to the display, TI recommends to use the following sequence for the SN65DSI83 device:

1. Clear the PLL_EN bit to 0 (CSR 0x0D.0).
2. Stop video streaming on DSI inputs.
3. Drive all DSI input lanes including DSI CLK lane to LP11.

When the system is ready to restart the video streaming.

1. Start video streaming on DSI inputs.
2. Set the PLL_EN bit to 1 (CSR 0x0D.0).
3. Wait for minimum of 3 ms.
4. Set the SOFT_RESET bit (0x09.0).

8.1.2 Reverse LVDS Pin Order Option

For ease of PCB routing, the SN65DSI83 device supports reversing the pin order via configuration register programming. The order of the LVDS pin for LVDS channel A can be reversed by setting the address 0x1A bit 5 CHA_REVERSE_LVDS. See the corresponding register bit definition for details.

8.1.3 IRQ Usage

The SN65DSI83 device provides an IRQ pin that can be used to indicate when certain errors occur on DSI. The IRQ output is enabled through the IRQ_EN bit (CSR 0xE0.0). The IRQ pin will be asserted when an error occurs on DSI, the corresponding error enable bit is set, and the IRQ_EN bit is set. An error is cleared by writing a 1 to the corresponding error status bit.

NOTE

If the SOFT_RESET bit is set while the DSI video stream is active, some of the error status bits may be set.

NOTE

If the DSI video stream is stopped, some of the error status bits may be set. These error status bits must be cleared before restarting the video stream.

NOTE

If the DSI video stream starts before the device is configured, some of the error status bits may be set. TI recommends to start streaming after the device is correctly configured as recommended in the initialization sequence in [Recommended Initialization Setup Sequence](#).

8.2 Typical Application

Figure 19 shows a typical application using the SN65DSI83 device for a single channel DSI receiver to interface a single-channel DSI application processor to an LVDS single-link 18 bit-per-pixel panel supporting 1280 × 800 WXGA resolutions at 60 frames per second.

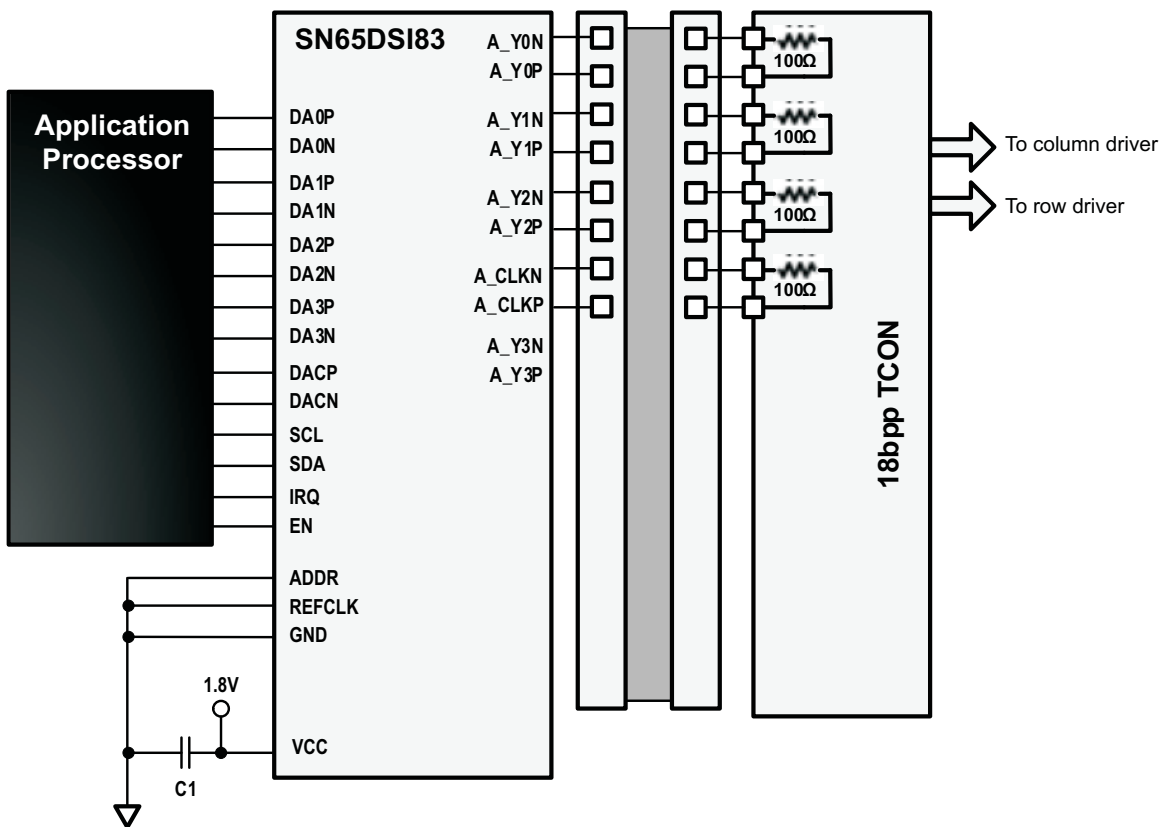

Figure 19. Typical WXGA 18-bpp Panel Application

8.2.1 Design Requirements

Table 10. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
VCC	1.8 V (±5%)
Clock Source (REFCLK or DSIA_CLK)	DSIA_CLK
REFCKL Frequency	N/A
DSIA Clock Frequency	500 MHz
PANEL INFORMATION	
Pixel Clock (MHz)	83 MHz
Horizontal Active (pixels)	1280
Horizontal Blanking (pixels)	384
Vertical Active (lines)	800
Vertical Blanking (lines)	30
Horizontal Sync Offset (pixels)	64
Horizontal Sync Pulse Width (pixels)	128
Vertical Sync Offset (lines)	3
Vertical Sync Pulse Width (lines)	7

Table 10. Design Parameters (continued)

DESIGN PARAMETERS	EXAMPLE VALUE
PANEL INFORMATION (continued)	
Horizontal Sync Pulse Polarity	Negative
Vertical Sync Pulse Polarity	Negative
Color Bit Depth (6 bpc or 8 bpc)	6-bit
Number of LVDS Lanes	1 × [3 Data Lanes + 1 Clock Lane]
DSI INFORMATION	
Number of DSI Lanes	1 × [4 Data Lanes + 1 Clock Lane]
DSI Clock Frequency(MHz)	500 MHz
Dual DSI Configuration(Odd/Even or Left/Right)	N/A

8.2.2 Detailed Design Procedure

The video resolution parameters required by the panel need to be programmed into the SN65DSI83 device. For this example, the parameters programmed would be the following:

Horizontal Active = 1280 or 0x500

CHA_ACTIVE_LINE_LENGTH_LOW = 0x00

CHA_ACTIVE_LINE_LENGTH_HIGH = 0x05

Vertical Active = 800 or 0x320

CHA_VERTICAL_DISPLAY_SIZE_LOW = 0x20

CHA_VERTICAL_DISPLAY_SIZE_HIGH = 0x03

Horizontal Pulse Width = 128 or 0x80

CHA_HSYNC_PULSE_WIDTH_LOW = 0x80

CHA_HSYNC_PULSE_WIDTH_HIGH = 0x00

Vertical Pulse Width = 7

CHA_VSYNC_PULSE_WIDTH_LOW = 0x07

CHA_VSYNC_PULSE_WIDTH_HIGH = 0x00

Horizontal Backporch = HorizontalBlanking – (HorizontalSyncOffset + HorizontalSyncPulseWidth)

Horizontal Backporch = 384 – (64 + 128)

Horizontal Backporch = 192 or 0xC0

CHA_HORIZONTAL_BACK_PORCH = 0xC0

Vertical Backporch = VerticalBlanking – (VerticalSyncOffset + VerticalSyncPulseWidth)

Vertical Backporch = 30 – (3 + 7)

Vertical Backporch = 20 or 0x14

CHA_VERTICAL_BACK_PORCH = 0x14

Horizontal Frontporch = HorizontalSyncOffset

Horizontal Frontporch = 64 or 0x40

CHA_HORIZONTAL_FRONT_PORCH = 0x40

Vertical Frontporch = VerticalSyncOffset

Vertical Frontporch = 3

CHA_VERTICAL_FRONT_PORCH = 0x03

The pattern generation feature can be enabled by setting the CHA_TEST_PATTERN bit at address 0x3C and configuring the TEST PATTERN GENERATION PURPOSE ONLY register as shown in [Table 8](#).

LVDS clock is derived from the DSI channel A clock. When the MIPI D-PHY channel A HS clock is used as the LVDS clock source, it is divided by the factor in DSI_CLK_DIVIDER (CSR 0x0B.7:3) to generate the FlatLink LVDS output clock. Additionally, LVDS_CLK_RANGE (CSR 0x0A.3:1) and CH_DSI_CLK_RANGE (CSR 0x12) must be set to the frequency range of the FlatLink LVDS output clock and DSI Channel A input clock respectively for the internal PLL to operate correctly. After these settings are programmed, PLL_EN (CSR 0x0D.0) must be set to enable the internal PLL.

LVDS_CLK_RANGE = 2 – $62.5 \text{ MHz} \leq \text{LVDS_CLK} < 87.5 \text{ MHz}$

HS_CLK_SRC = 1 – LVDS pixel clock derived from MIPI D-PHY channel A

DSI_CLK_DIVIDER = 00101 – Divide by 6

CHA_DSI_LANES = 00 – Four lanes are enabled

CHA_DSI_CLK_RANGE = 0x64 – 500 MHz

8.2.2.1 Example Script

This example configures the SN65DSI83 device for the following configuration:

```

<aardvark>

Figure 20. Power Consumption

9 Power Supply Recommendations

9.1 V_{CC} Power Supply

Each VCC power supply pin must have a 100-nF capacitor to ground connected as close as possible to the SN65DSI83 device. It is recommended to have one bulk capacitor (1 µF to 10 µF) on it. It is also recommended to have the pins connected to a solid power plane.

9.2 V_{CORE} Power Supply

This pin must have a 100-nF capacitor to ground connected as close as possible to the SN65DSI83 device. It is recommended to have one bulk capacitor (1 µF to 10 µF) on it. It is also recommended to have the pins connected to a solid power plane.

10 Layout

10.1 Layout Guidelines

10.1.1 Package Specific

For the ZQE package, to minimize the power supply noise floor, provide good decoupling near the SN65DSI83 device power pins. The use of four ceramic capacitors ($2 \times 0.1 \mu\text{F}$ and $2 \times 0.01 \mu\text{F}$) provides good performance. At the least, TI recommends to install one $0.1\text{-}\mu\text{F}$ and one $0.01\text{-}\mu\text{F}$ capacitor near the SN65DSI83 device. To avoid large current loops and trace inductance, the trace length between decoupling capacitor and device power inputs pins must be minimized. Placing the capacitor underneath the SN65DSI83 device on the bottom of the PCB is often a good choice.

Layout Guidelines (continued)

10.1.2 Differential Pairs

- Differential pairs must be routed with controlled 100-Ω differential impedance ($\pm 20\%$) or 50-Ω single-ended impedance ($\pm 15\%$).
- Keep away from other high speed signals
- Keep lengths to within 5 mils of each other.
- Length matching must be near the location of mismatch.
- Each pair must be separated at least by 3 times the signal trace width.
- The use of bends in differential traces must be kept to a minimum. When bends are used, the number of left and right bends must be as equal as possible and the angle of the bend must be ≥ 135 degrees. This arrangement minimizes any length mismatch caused by the bends and therefore minimizes the impact that bends have on EMI.
- Route all differential pairs on the same of layer.
- The number of vias must be kept to a minimum. It is recommended to keep the via count to 2 or less.
- Keep traces on layers adjacent to ground plane.
- Do NOT route differential pairs over any plane split.
- Adding Test points will cause impedance discontinuity and will therefore negatively impact signal performance. If test points are used, they must be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair.

10.1.3 Ground

TI recommends that only one board ground plane be used in the design. This provides the best image plane for signal traces running above the plane. The thermal pad of the SN65DSI83 must be connected to this plane with vias.

10.2 Layout Example

Green - Top Layer, Purple - Layer 3, Blue - Bottom Layer

11.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.2 Trademarks

FlatLink, E2E are trademarks of Texas Instruments.
 MIPI is a registered trademark of Arasan Chip Systems, Inc.
 All other trademarks are the property of their respective owners.

11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65DSI83ZQER	ACTIVE	BGA MICROSTAR JUNIOR	ZQE	64	2500	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	-40 to 85	DSI83	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
