

# TCA6424 Low-Voltage 24-Bit I<sup>2</sup>C AND SMBus I/O Expander With Interrupt Output, Reset, and Configuration Registers

*Not Recommended for New Designs*

## 1 Features

- Operating Power-Supply Voltage Range of 1.65 V to 5.5 V
- Allows Bidirectional Voltage-Level Translation and GPIO Expansion Between:
  - 1.8-V SCL/SDA and 1.8-V, 2.5-V, 3.3-V, or 5-V P Port
  - 2.5-V SCL/SDA and 1.8-V, 2.5-V, 3.3-V, or 5-V P Port
  - 3.3-V SCL/SDA and 1.8-V, 2.5-V, 3.3-V, or 5-V P Port
  - 5-V SCL/SDA and 1.8-V, 2.5-V, 3.3-V, or 5-V P Port
- I<sup>2</sup>C to Parallel Port Expander
- Low Standby Current Consumption of 1  $\mu$ A
- Schmitt-Trigger Action Allows Slow Input Transition and Better Switching Noise Immunity at the SCL and SDA Inputs
  - $V_{hys} = 0.18$  V Typ at 1.8 V
  - $V_{hys} = 0.25$  V Typ at 2.5 V
  - $V_{hys} = 0.33$  V Typ at 3.3 V
  - $V_{hys} = 0.5$  V Typ at 5 V
- 5-V Tolerant I/O Ports
- Active-Low Reset ( $\overline{\text{RESET}}$ ) Input
- Open-Drain Active-Low Interrupt ( $\overline{\text{INT}}$ ) Output
- 400-kHz Fast I<sup>2</sup>C Bus
- Input/Output Configuration Register
- Polarity Inversion Register
- Internal Power-On Reset
- Power Up With All Channels Configured as Inputs
- No Glitch On Power Up
- Noise Filter on SCL/SDA Inputs
- Latched Outputs With High-Current Drive  
Maximum Capability for Directly Driving LEDs
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22
  - 2000-V Human-Body Model (A114-A)
  - 200-V Machine Model (A115-A)
  - 1000-V Charged-Device Model (C101)

## 2 Description

This 24-bit I/O expander for the two-line bidirectional bus (I<sup>2</sup>C) is designed to provide general-purpose remote I/O expansion for most microcontroller families via the I<sup>2</sup>C interface [serial clock (SCL) and serial data (SDA)].

The major benefit of this device is its wide  $V_{CC}$  range. It can operate from 1.65 V to 5.5 V on the P-port side and on the SDA/SCL side. This allows the TCA6424 to interface with next-generation microprocessors and microcontrollers on the SDA/SCL side, where supply levels are dropping down to conserve power. In contrast to the dropping power supplies of microprocessors and microcontrollers, some PCB components, such as LEDs, remain at a 5-V power supply.

The bidirectional voltage level translation in the TCA6424 is provided through  $V_{CCI}$ .  $V_{CCI}$  should be connected to the  $V_{CC}$  of the external SCL/SDA lines. This indicates the  $V_{CC}$  level of the I<sup>2</sup>C bus to the TCA6424. The voltage level on the P-port of the TCA6424 is determined by the  $V_{CCP}$ .

### Device Information<sup>(1)</sup>

| PART NUMBER | PACKAGE   | BODY SIZE (NOM)   |
|-------------|-----------|-------------------|
| TCA6424     | UQFN (32) | 5.00 mm x 5.00 mm |

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Description (Continued)

The TCA6424 consists of three 8-bit Configuration (input or output selection), Input, Output, and Polarity Inversion (active high) registers. At power on, the I/Os are configured as inputs. However, the system master can enable the I/Os as either inputs or outputs by writing to the I/O configuration bits. The data for each input or output is kept in the corresponding input or output register. The polarity of the Input Port register can be inverted with the Polarity Inversion register. All registers can be read by the system master.

The system master can reset the TCA6424 in the event of a timeout or other improper operation by asserting a low in the  $\overline{\text{RESET}}$  input. The power-on reset puts the registers in their default state and initializes the I<sup>2</sup>C/SMBus state machine. The  $\overline{\text{RESET}}$  pin causes the same reset/initialization to occur without depowering the part.

The TCA6424 open-drain interrupt ( $\overline{\text{INT}}$ ) output is activated when any input state differs from its corresponding Input Port register state and is used to indicate to the system master that an input state has changed.

$\overline{\text{INT}}$  can be connected to the interrupt input of a microcontroller. By sending an interrupt signal on this line, the remote I/O can inform the microcontroller if there is incoming data on its ports without having to communicate via the I<sup>2</sup>C bus. Thus, the TCA6424 can remain a simple slave device.

The device P-port outputs have high-current sink capabilities for directly driving LEDs while consuming low device current.

One hardware pin (ADDR) can be used to program and vary the fixed I<sup>2</sup>C address and allow up to two devices to share the same I<sup>2</sup>C bus or SMBus.

| I <sub>CC</sub>  | Continuous current through GND              |                                       |      | 200   | mA   |
|                  | Continuous current through V <sub>CCP</sub> |                                       |      | 160   |      |
|                  | Continuous current through V <sub>CCI</sub> |                                       |      | 10    |      |
| θ <sub>JA</sub>  | Package thermal impedance <sup>(3)</sup>    | RGJ package                           |      | 50.05 | °C/W |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

(3) The package thermal impedance is calculated in accordance with JESD 51-7.

### 6.2 Handling Ratings

|                    |                           |  | MIN | MAX  | UNIT |
|--------------------|---------------------------|--|-----|------|------|
| T <sub>stg</sub>   | Storage temperature range |  | –65 | 150  | °C   |
| V <sub>(ESD)</sub> | Electrostatic discharge   | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>              | 0   | 2000 | V    |
|                    |                           | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup> | 0   | 1000 |      |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

## 7 Parameter Measurement Information

## SDA LOAD CONFIGURATION

## VOLTAGE WAVEFORMS

| BYTE | DESCRIPTION              |
|------|--------------------------|
| 1    | I <sup>2</sup> C address |
| 2    | Input register port data |

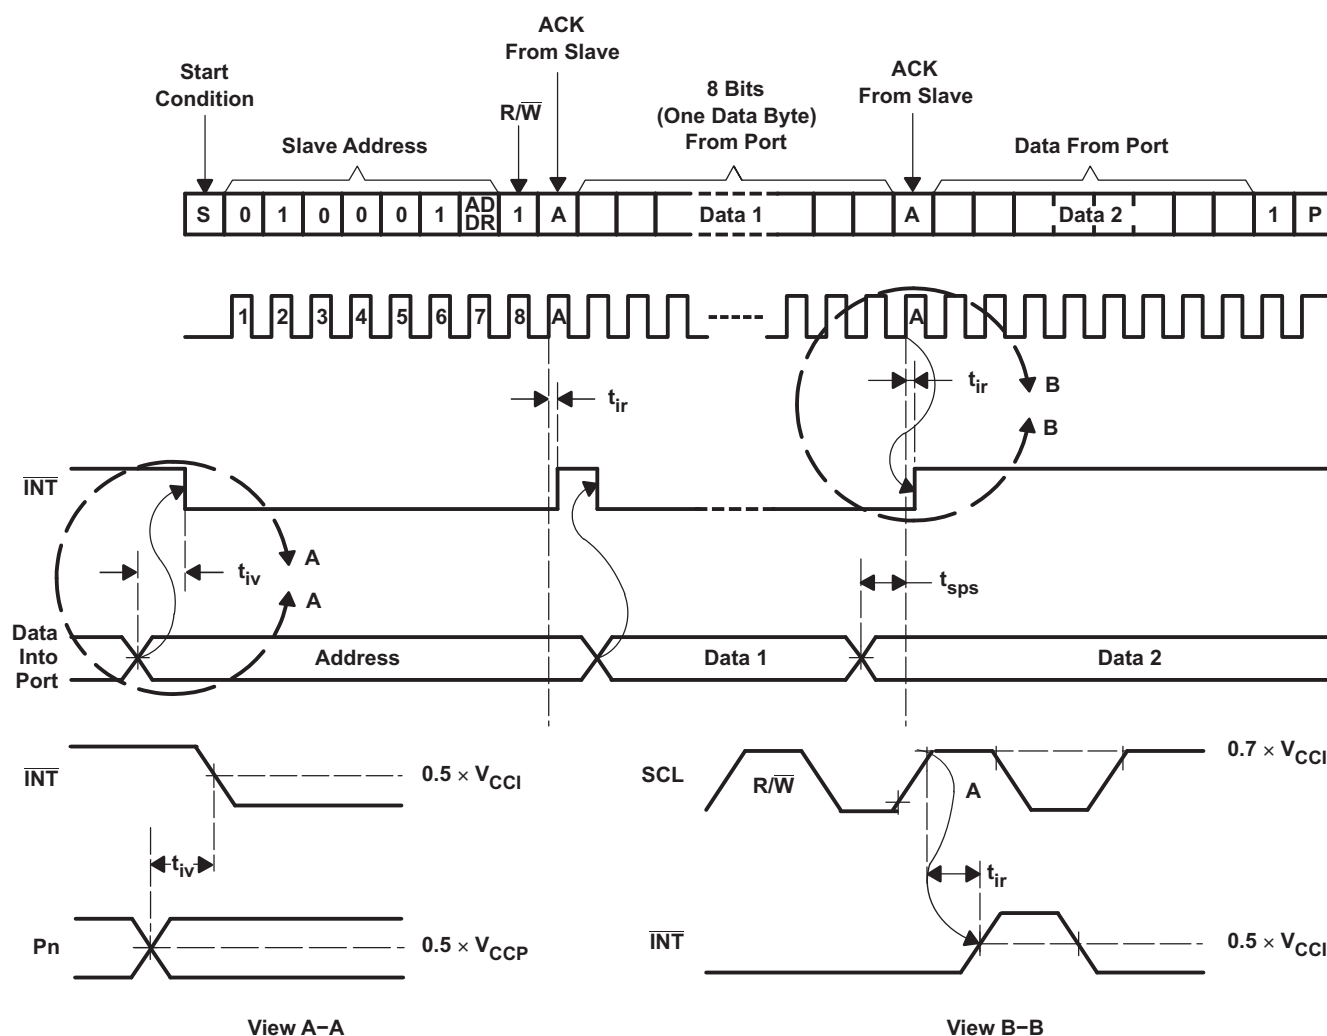

- A.  $C_L$  includes probe and jig capacitance.  $t_{ocf}$  is measured with  $C_L$  of 10 pF or 400 pF.
- B. All inputs are supplied by generators having the following characteristics:  $PRR \leq 10$  MHz,  $Z_O = 50 \Omega$ ,  $t_r/t_f \leq 30$  ns.
- C. All parameters and waveforms are not applicable to all devices.

### Figure 14. I<sup>2</sup>C Interface Load Circuit And Voltage Waveforms

## Parameter Measurement Information (continued)

INTERRUPT LOAD CONFIGURATION

- A.  $C_L$  includes probe and jig capacitance.
- B. All inputs are supplied by generators having the following characteristics:  $PRR \leq 10 \text{ MHz}$ ,  $Z_O = 50 \Omega$ ,  $t_r/t_f \leq 30 \text{ ns}$ .
- C. All parameters and waveforms are not applicable to all devices.

**Figure 15. Interrupt Load Circuit And Voltage Waveforms**

### Parameter Measurement Information (continued)

**P PORT LOAD CONFIGURATION**

**WRITE MODE ( $R/\bar{W} = 0$ )**

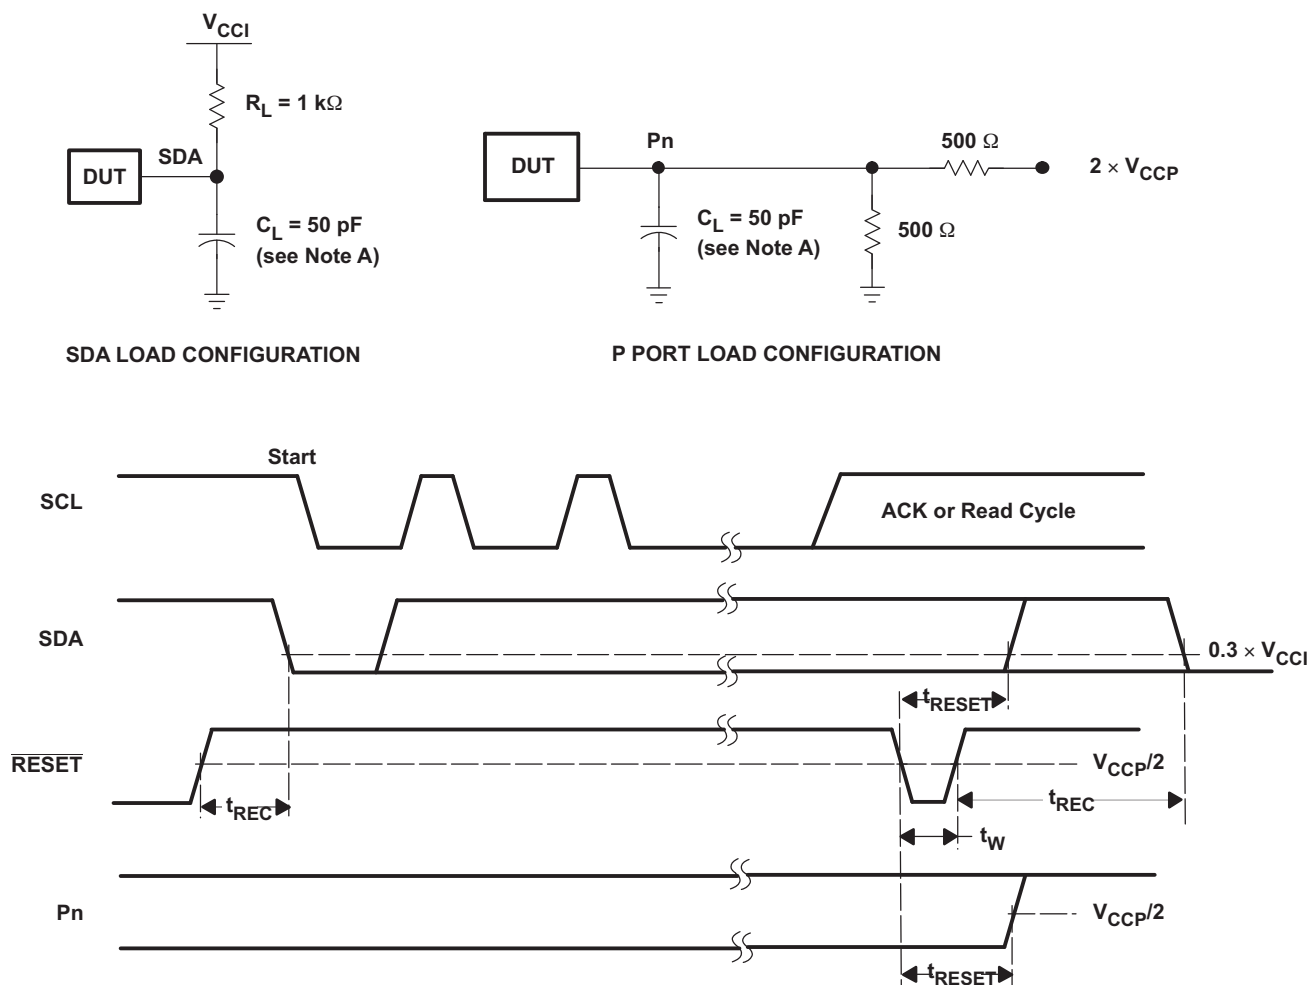

**READ MODE ( $R/\bar{W} = 1$ )**

- A.  $C_L$  includes probe and jig capacitance.
- B.  $t_{pv}$  is measured from  $0.7 \times V_{CC}$  on SCL to 50% I/O (Pn) output.
- C. All inputs are supplied by generators having the following characteristics: PRR  $\leq 10 \text{ MHz}$ ,  $Z_O = 50 \Omega$ ,  $t_r/t_f \leq 30 \text{ ns}$ .
- D. The outputs are measured one at a time, with one transition per measurement.
- E. All parameters and waveforms are not applicable to all devices.

**Figure 16. P-Port Load Circuit And Timing Waveforms**

## Parameter Measurement Information (continued)

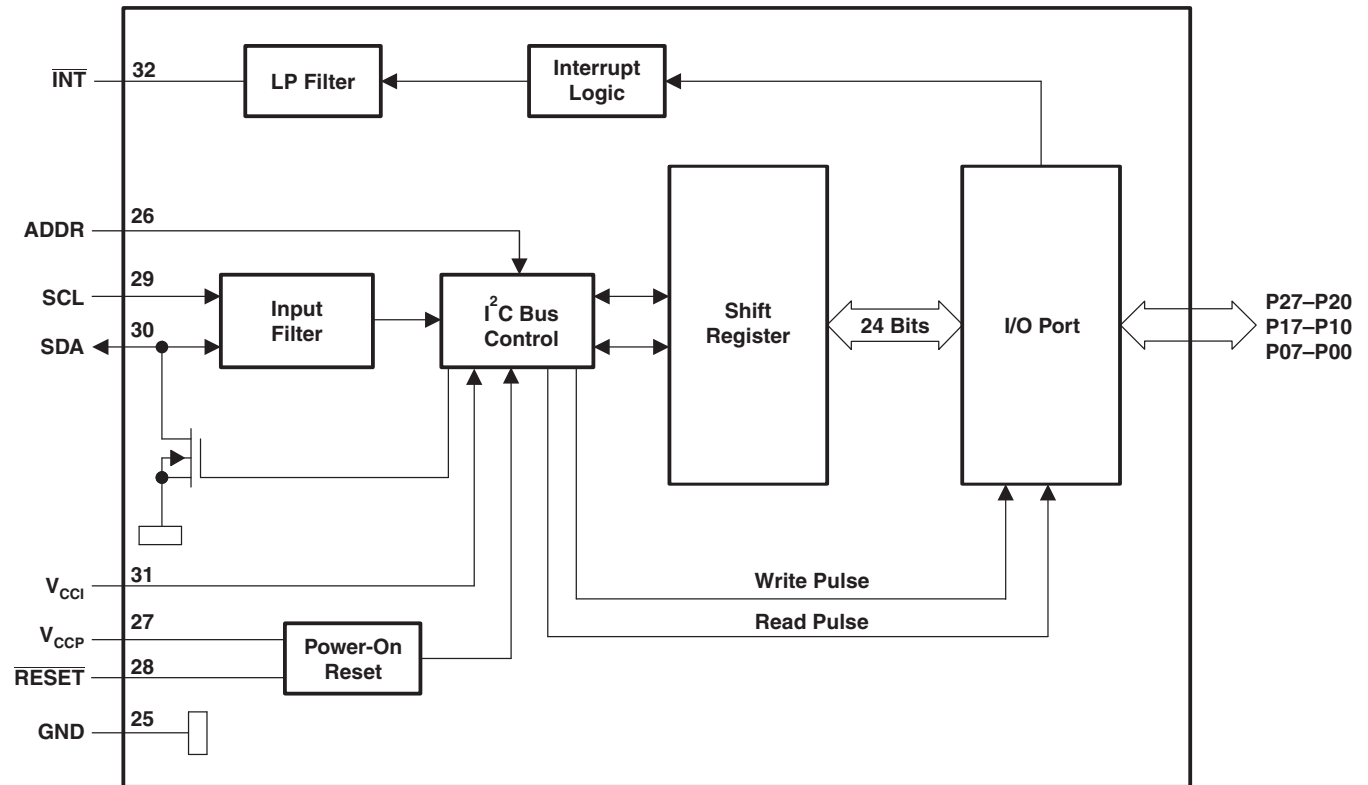

- A.  $C_L$  includes probe and jig capacitance.
- B. All inputs are supplied by generators having the following characteristics:  $PRR \leq 10$  MHz,  $Z_O = 50 \Omega$ ,  $t_r/t_f \leq 30$  ns.
- C. The outputs are measured one at a time, with one transition per measurement.
- D. I/Os are configured as inputs.
- E. All parameters and waveforms are not applicable to all devices.

## 8.2 Device Functional Modes

### 8.2.1 Voltage Translation

Table 1 shows how to set up  $V_{CC}$  levels for the necessary voltage translation between the I<sup>2</sup>C bus and the TCA6424.

**Table 1. Voltage Translation**

| $V_{CCI}$ (SDA AND SCL OF I <sup>2</sup> C MASTER)<br>(V) | $V_{CCP}$ (P PORT)<br>(V) |
|---|---------------------------|
| 1.8   | 1.8                       |
| 1.8   | 2.5                       |
| 1.8   | 3.3                       |
| 1.8   | 5                         |
| 2.5   | 1.8                       |
| 2.5   | 2.5                       |
| 2.5   | 3.3                       |
| 2.5   | 5                         |
| 3.3   | 1.8                       |
| 3.3   | 2.5                       |
| 3.3   | 3.3                       |
| 3.3   | 5                         |
| 5   | 1.8                       |
| 5   | 2.5                       |
| 5   | 3.3                       |
| 5   | 5                         |

### 8.2.2 Reset Input ( $\overline{\text{RESET}}$ )

The  $\overline{\text{RESET}}$  input can be asserted to initialize the system while keeping the  $V_{CCP}$  at its operating level. A reset can be accomplished by holding the  $\overline{\text{RESET}}$  pin low for a minimum of  $t_{W\overline{\text{RESET}}}$ . The TCA6424 registers and I<sup>2</sup>C/SMBus state machine are changed to their default state once  $\overline{\text{RESET}}$  is low (0). When  $\overline{\text{RESET}}$  is high (1), the I/O levels at the P port can be changed externally or through the master. This input requires a pullup resistor to  $V_{CCP}$ , if no active connection is used.

#### 8.2.2.1 $\overline{\text{RESET}}$ Errata

If  $\overline{\text{RESET}}$  voltage set higher than VCC, current will flow from  $\overline{\text{RESET}}$  pin to VCC pin.

#### System Impact

VCC will be pulled above its regular voltage level

#### System Workaround

Design such that  $\overline{\text{RESET}}$  voltage is same or lower than VCC

### 8.2.3 Power-On Reset

When power (from 0 V) is applied to  $V_{CCP}$ , an internal power-on reset holds the TCA6424 in a reset condition until  $V_{CCP}$  has reached  $V_{POR}$ . At that time, the reset condition is released, and the TCA6424 registers and I<sup>2</sup>C/SMBus state machine initializes to their default states. After that,  $V_{CCP}$  must be lowered to below 0.2 V and back up to the operating voltage for a power-reset cycle.

**TCA6424**

SCPS175B –NOVEMBER 2007–REVISED JUNE 2014

[www.ti.com](http://www.ti.com)**8.2.4 I/O Port**

When an I/O is configured as an input, FETs Q1 and Q2 (in [Figure 19](#)) are off, which creates a high-impedance input. The input voltage may be raised above  $V_{CC}$  to a maximum of 5.5 V.

If the I/O is configured as an output, Q1 or Q2 is enabled, depending on the state of the output port register. In this case, there are low-impedance paths between the I/O pin and either  $V_{CC}$  or GND. The external voltage applied to this I/O pin should not exceed the recommended levels for proper operation.

**8.2.5 Interrupt ( $\overline{INT}$ ) Output**

An interrupt is generated by any rising or falling edge of the port inputs in the input mode. After time  $t_{IV}$ , the signal  $\overline{INT}$  is valid. Resetting the interrupt circuit is achieved when data on the port is changed to the original setting, data is read from the port that generated the interrupt or in a stop event. Resetting occurs in the read mode at the acknowledge (ACK) or not acknowledge (NACK) bit after the rising edge of the SCL signal. Interrupts that occur during the ACK or NACK clock pulse can be lost (or be very short) due to the resetting of the interrupt during this pulse. Each change of the I/Os after resetting is detected and is transmitted as  $\overline{INT}$ .

Reading from or writing to another device does not affect the interrupt circuit, and a pin configured as an output cannot cause an interrupt. Changing an I/O from an output to an input may cause a false interrupt to occur, if the state of the pin does not match the contents of the Input Port register.

In the TCA6424, an interrupt is not immediately generated by any rising or falling edge of port inputs in input mode after issuing any I<sup>2</sup>C commands (read or write). In order to capture the  $\overline{INT}$  in the TCA6424, the user needs to add one more SCL clock pulse after a Stop signal.

The  $\overline{INT}$  output has an open-drain structure and requires a pullup resistor to  $V_{CCP}$  or  $V_{CCI}$  depending on the application. If the  $\overline{INT}$  signal is connected back to the processor that provides the SCL signal to the TCA6424, then the  $\overline{INT}$  pin has to be connected to  $V_{CCI}$ . If not, the INT pin can be connected to  $V_{CCP}$ .

**8.2.5.1 Interrupt Errata**

The INT will be improperly de-asserted if the following two conditions occur:

1. The last I<sup>2</sup>C command byte (register pointer) written to the device was 00h.

**NOTE**

This generally means the last operation with the device was a Read of the input register. However, the command byte may have been written with 00h without ever going on to read the input register. After reading from the device, if no other command byte written, it will remain 00h.

2. Any other slave device on the I<sup>2</sup>C bus acknowledges an address byte with the R/W bit set high

**System Impact**

Can cause improper interrupt handling as the Master will see the interrupt as being cleared.

**System Workaround**

Minor software change: User must change command byte to something besides 00h after a Read operation to the TCA6424 device or before reading from another slave device.

**NOTE**

Software change will be compatible with other versions (competition and TI redesigns) of this device.

## 8.3 Programming

### 8.3.1 I<sup>2</sup>C Interface

The bidirectional I<sup>2</sup>C bus consists of the serial clock (SCL) and serial data (SDA) lines. Both lines must be connected to a positive supply through a pullup resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

I<sup>2</sup>C communication with this device is initiated by a master sending a Start condition, a high-to-low transition on the SDA input/output, while the SCL input is high (see Figure 20). After the Start condition, the device address byte is sent, most significant bit (MSB) first, including the data direction bit (R/W).

After receiving the valid address byte, this device responds with an acknowledge (ACK), a low on the SDA input/output during the high of the ACK-related clock pulse. The address (ADDR) input of the slave device must not be changed between the Start and the Stop conditions.

On the I<sup>2</sup>C bus, only one data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the high pulse of the clock period, as changes in the data line at this time are interpreted as control commands (Start or Stop) (see Figure 21).

A Stop condition, a low-to-high transition on the SDA input/output while the SCL input is high, is sent by the master (see Figure 20).

Any number of data bytes can be transferred from the transmitter to receiver between the Start and the Stop conditions. Each byte of eight bits is followed by one ACK bit. The transmitter must release the SDA line before the receiver can send an ACK bit. The device that acknowledges must pull down the SDA line during the ACK clock pulse, so that the SDA line is stable low during the high pulse of the ACK-related clock period (see Figure 22). When a slave receiver is addressed, it must generate an ACK after each byte is received. Similarly, the master must generate an ACK after each byte that it receives from the slave transmitter. Setup and hold times must be met to ensure proper operation.

A master receiver signals an end of data to the slave transmitter by not generating an acknowledge (NACK) after the last byte has been clocked out of the slave. This is done by the master receiver by holding the SDA line high. In this event, the transmitter must release the data line to enable the master to generate a Stop condition.

### 8.3.2 Register Map

Table 2. Interface Definition

| BYTE              | BIT     |     |     |     |     |     |      |                   |
|-------------------|---------|-----|-----|-----|-----|-----|------|-------------------|
|                   | 7 (MSB) | 6   | 5   | 4   | 3   | 2   | 1    | 0 (LSB)           |
| I²C slave address | L       | H   | L   | L   | L   | H   | ADDR | R/ $\overline{W}$ |
| I/O data bus      | P07     | P06 | P05 | P04 | P03 | P02 | P01  | P00               |
|                   | P17     | P16 | P15 | P14 | P13 | P12 | P11  | P10               |
|                   | P27     | P26 | P25 | P24 | P23 | P22 | P21  | P20               |

#### 8.3.2.1 Device Address

The address of the TCA6424 is shown in [Figure 23](#).

Figure 23. Tca6424 Address

Table 3. Address Reference

| ADDR | I²C BUS SLAVE ADDRESS          |
|------|--------------------------------|
| L    | 34 (decimal), 22 (hexadecimal) |
| H    | 35 (decimal), 23 (hexadecimal) |

The last bit of the slave address defines the operation (read or write) to be performed. A high (1) selects a read operation, while a low (0) selects a write operation.

### 8.3.2.2 Control Register And Command Byte

Following the successful acknowledgment of the address byte, the bus master sends a command byte, which is stored in the control register in the TCA6424. Four bits of this data byte state the operation (read or write) and the internal registers (input, output, polarity inversion, or configuration) that will be affected. The control register can be written or read through the I<sup>2</sup>C bus. The command byte is sent only during a write transmission.

The control register includes an Auto-Increment (AI) bit which is the most significant bit (bit 7) of the command byte. At power-up, the control register defaults to 00 (hex), with the AI bit set to logic 1, and the lowest 7 bits set to logic 0.

If AI is 1, the 2 least significant bits are automatically incremented after a read or write. This allows the user to program and/or read the 3 register banks sequentially. If more than 3 bytes of data are written when AI is 1, previous data in the selected registers will be overwritten. Reserved registers are skipped and not accessed (refer to Table 5).

If AI is 0, the 2 least significant bits are not incremented after data is read or written. During a read operation, the same register bank is read each time. During a write operation, data is written to the same register bank each time.

Reserved command codes and command byte outside the range stated in the Command Byte table must not be accessed for proper device functionality.

|    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|
| AI | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
|----|----|----|----|----|----|----|----|

### 8.3.2.3 Register Descriptions

The Input Port registers (registers 0, 1 and 2) reflect the incoming logic levels of the pins, regardless of whether the pin is defined as an input or an output by the Configuration register. They act only on read operation. Writes to these registers have no effect. The default value (X) is determined by the externally applied logic level. Before a read operation, a write transmission is sent with the command byte to indicate to the I<sup>2</sup>C device that the Input Port register will be accessed next.

**Table 5. Registers 0 And 1 (Input Port Registers)**

| BIT     | I-07 | I-06 | I-05 | I-04 | I-03 | I-02 | I-01 | I-00 |
|---------|------|------|------|------|------|------|------|------|
| DEFAULT | X    | X    | X    | X    | X    | X    | X    | X    |
| BIT     | I-17 | I-16 | I-15 | I-14 | I-13 | I-12 | I-11 | I-10 |
| DEFAULT | X    | X    | X    | X    | X    | X    | X    | X    |
| BIT     | I-27 | I-26 | I-25 | I-24 | I-23 | I-22 | I-21 | I-20 |
| DEFAULT | X    | X    | X    | X    | X    | X    | X    | X    |

The Output Port registers (registers 4, 5 and 6) shows the outgoing logic levels of the pins defined as outputs by the Configuration register. Bit values in these registers have no effect on pins defined as inputs. In turn, reads from these registers reflect the value that is in the flip-flop controlling the output selection, NOT the actual pin value.

**Table 6. Registers 2 And 3 (Output Port Registers)**

| BIT     | O-07 | O-06 | O-05 | O-04 | O-03 | O-02 | O-01 | O-00 |
|---------|------|------|------|------|------|------|------|------|
| DEFAULT | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    |
| BIT     | O-17 | O-16 | O-15 | O-14 | O-13 | O-12 | O-11 | O-10 |
| DEFAULT | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    |
| BIT     | O-27 | O-26 | O-25 | O-24 | O-23 | O-22 | O-21 | O-20 |
| DEFAULT | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    |

The Polarity Inversion registers (registers 8, 9 and 10) allow polarity inversion of pins defined as inputs by the Configuration register. If a bit in these registers is set (written with 1), the corresponding port pin's polarity is inverted. If a bit in these registers is cleared (written with a 0), the corresponding port pin's original polarity is retained.

**Table 7. Registers 4 And 5 (Polarity Inversion Registers)**

| BIT     | P-07 | P-06 | P-05 | P-04 | P-03 | P-02 | P-01 | P-00 |
|---------|------|------|------|------|------|------|------|------|
| DEFAULT | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |
| BIT     | P-17 | P-16 | P-15 | P-14 | P-13 | P-12 | P-11 | P-10 |
| DEFAULT | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |
| BIT     | P-27 | P-26 | P-25 | P-24 | P-23 | P-22 | P-21 | P-20 |
| DEFAULT | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

The Configuration registers (registers 12, 13 and 14) configure the direction of the I/O pins. If a bit in these registers is set to 1, the corresponding port pin is enabled as an input with a high-impedance output driver. If a bit in these registers is cleared to 0, the corresponding port pin is enabled as an output.

**Table 8. Registers 6 And 7 (Configuration Registers)**

| BIT     | C-07 | C-06 | C-05 | C-04 | C-03 | C-02 | C-01 | C-00 |
|---------|------|------|------|------|------|------|------|------|
| DEFAULT | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    |
| BIT     | C-17 | C-16 | C-15 | C-14 | C-13 | C-12 | C-11 | C-10 |
| DEFAULT | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    |
| BIT     | C-27 | C-26 | C-25 | C-24 | C-23 | C-22 | C-21 | C-20 |
| DEFAULT | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    |

**TCA6424**

SCPS175B –NOVEMBER 2007–REVISED JUNE 2014

[www.ti.com](http://www.ti.com)**8.3.2.4 Bus Transactions**

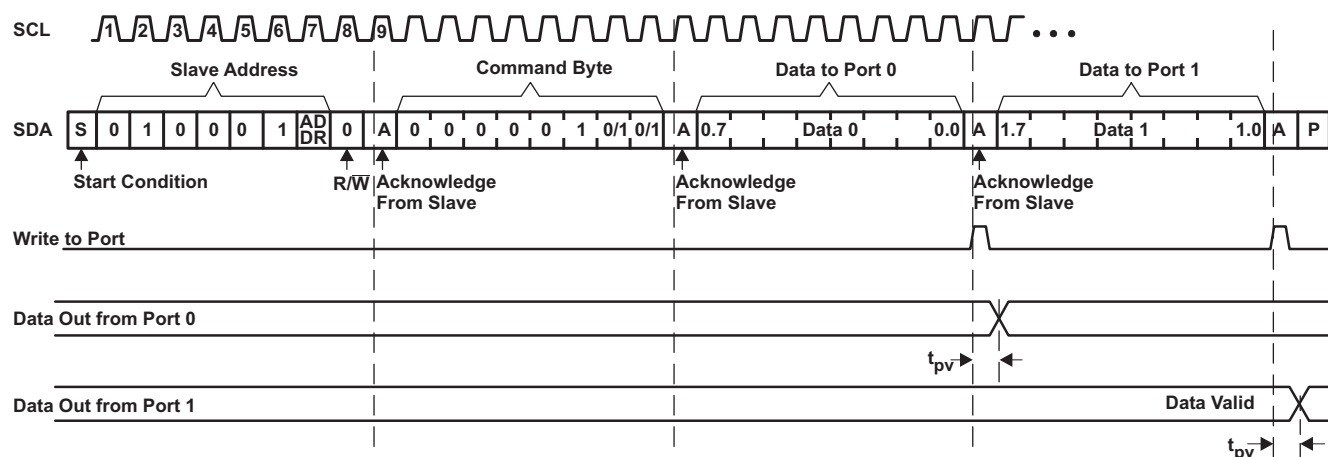

Data is exchanged between the master and TCA6424 through write and read commands.

**8.3.2.4.1 Writes**

Data is transmitted to the TCA6424 by sending the device address and setting the least-significant bit (LSB) to a logic 0 (see [Figure 23](#) for device address). The command byte is sent after the address and determines which register receives the data that follows the command byte. There is no limitation on the number of data bytes sent in one write transmission.

The twelve registers within the TCA6424 are grouped into four different sets. The four sets of registers are input ports, output ports, polarity inversion ports and configuration ports. After sending data to one register, the next data byte is sent to the next register in the group of 3 registers (see [Figure 25](#) and [Figure 26](#)). For example, if the first byte is sent to Output Port 2 (register 6), the next byte is stored in Output Port 0 (register 4).

There is no limitation on the number of data bytes sent in one write transmission. In this way, each 8-bit register may be updated independently of the other registers.

**Figure 25. Write To Output Port Register****Figure 26. Write To Configuration Or Polarity Inversion Registers**

### 8.3.2.4.2 Reads

The bus master first must send the TCA6424 address with the LSB set to a logic 0 (see Figure 23 for device address). The command byte is sent after the address and determines which register is accessed.

After a restart, the device address is sent again but, this time, the LSB is set to a logic 1. Data from the register defined by the command byte then is sent by the TCA6424 (see Figure 27 and Figure 28).

After a restart, the value of the register defined by the command byte matches the register being accessed when the restart occurred. For example, if the command byte references Input Port 1 before the restart, and the restart occurs when Input Port 0 is being read, the stored command byte changes to reference Input Port 0. The original command byte is forgotten. If a subsequent restart occurs, Input Port 0 is read first. Data is clocked into the register on the rising edge of the ACK clock pulse. After the first byte is read, additional bytes may be read, but the data now reflects the information in the other register in the pair. For example, if Input Port 1 is read, the next byte read is Input Port 0.

Data is clocked into the register on the rising edge of the ACK clock pulse. There is no limitation on the number of data bytes received in one read transmission, but when the final byte is received, the bus master must not acknowledge the data.

**Figure 27. Read From Register**

- Transfer of data can be stopped at any time by a Stop condition. When this occurs, data present at the latest acknowledge phase is valid (output mode). It is assumed that the command byte previously has been set to 00 (read Input Port register).
- This figure eliminates the command byte transfer, a restart, and slave address call between the initial slave address call and actual data transfer from P port (see Figure 27).
- Auto-increment mode is enabled.

**Figure 28. Read Input Port Register**

## Typical Application (continued)

### 9.1.1 Detailed Design Procedure

#### 9.1.1.1 Minimizing $I_{CC}$ When I/Os Control Leds

When the I/Os are used to control LEDs, normally they are connected to  $V_{CC}$  through a resistor as shown in Figure 29. The LED acts as a diode so, when the LED is off, the I/O  $V_{IN}$  is about 1.2 V less than  $V_{CC}$ . The  $\Delta I_{CC}$  parameter in Electrical Characteristics shows how  $I_{CC}$  increases as  $V_{IN}$  becomes lower than  $V_{CC}$ . Designs that must minimize current consumption, such as battery power applications, should consider maintaining the I/O pins greater than or equal to  $V_{CC}$  when the LED is off.

Figure 30 shows a high-value resistor in parallel with the LED. Figure 31 shows  $V_{CC}$  less than the LED supply voltage by at least 1.2 V. Both of these methods maintain the I/O  $V_{IN}$  at or above  $V_{CC}$  and prevent additional supply current consumption when the LED is off.

**Figure 30. High-Value Resistor In Parallel With The Led**

**10 Power Supply Recommendations****10.1 Power-On Reset Requirements**

In the event of a glitch or data corruption, TCA6424 can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

The two types of power-on reset are shown in [Figure 32](#) and [Figure 33](#).

**Figure 32.  $V_{CC}$  Is Lowered Below 0.2 V Or 0 V And Then Ramped Up To  $V_{CC}$**

**Figure 33.  $V_{CC}$  Is Lowered Below The Por Threshold, Then Ramped Back Up To  $V_{CC}$**

[Table 9](#) specifies the performance of the power-on reset feature for TCA6424 for both types of power-on reset.

**Table 9. Recommended Supply Sequencing And Ramp Rates<sup>(1)</sup>**

| PARAMETER            |   |                               | MIN   | TYP | MAX   | UNIT    |
|----------------------|---|-------------------------------|-------|-----|-------|---------|
| $V_{CC\_FT}$         | Fall rate   | See <a href="#">Figure 32</a> | 1     |     | 100   | ms      |
| $V_{CC\_RT}$         | Rise rate   | See <a href="#">Figure 32</a> | 0.01  |     | 100   | ms      |
| $V_{CC\_TRR\_GND}$   | Time to re-ramp (when $V_{CC}$ drops to GND)  | See <a href="#">Figure 32</a> | 0.001 |     |       | ms      |
| $V_{CC\_TRR\_POR50}$ | Time to re-ramp (when $V_{CC}$ drops to $V_{POR\_MIN} - 50$ mV)   | See <a href="#">Figure 33</a> | 0.001 |     |       | ms      |
| $V_{CC\_GH}$         | Level that $V_{CCP}$ can glitch down to, but not cause a functional disruption when $V_{CCX\_GW} = 1$ $\mu$ s | See <a href="#">Figure 34</a> |       |     | 1.2   | V       |
| $V_{CC\_GW}$         | Glitch width that will not cause a functional disruption when $V_{CCX\_GH} = 0.5 \times V_{CCx}$              | See <a href="#">Figure 34</a> |       |     |       | $\mu$ s |
| $V_{PORF}$           | Voltage trip point of POR on falling $V_{CC}$   |                               | 0.767 |     | 1.144 | V       |
| $V_{PORR}$           | Voltage trip point of POR on rising $V_{CC}$  |                               | 1.033 |     | 1.428 | V       |

(1)  $T_A = -40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  (unless otherwise noted)

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width ( $V_{CC\_GW}$ ) and height ( $V_{CC\_GH}$ ) are dependent on each other. The bypass capacitance, source impedance, and device impedance are factors that affect power-on reset performance. Figure 34 and Table 9 provide more information on how to measure these specifications.

**Figure 34. Glitch Width And Glitch Height**

$V_{POR}$  is critical to the power-on reset.  $V_{POR}$  is the voltage level at which the reset condition is released and all the registers and the I<sup>2</sup>C/SMBus state machine are initialized to their default states. The value of  $V_{POR}$  differs based on the  $V_{CC}$  being lowered to or from 0. Figure 35 and Table 9 provide more details on this specification.

**Figure 35.  $V_{POR}$**

## 11 Device and Documentation Support

### 11.1 Trademarks

All trademarks are the property of their respective owners.

### 11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.3 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

| Orderable Device | Status<br>(1) | Package Type | Package<br>Drawing | Pins | Package<br>Qty | Eco Plan<br>(2)            | Lead/Ball Finish<br>(6) | MSL Peak Temp<br>(3) | Op Temp (°C) | Device Marking<br>(4/5) | Samples |
|------------------|---------------|--------------|--------------------|------|----------------|----------------------------|-------------------------|----------------------|--------------|-------------------------|---------|
| TCA6424RGJR      | NRND          | UQFN         | RGJ                | 32   | 3000           | Green (RoHS<br>& no Sb/Br) | CU NIPDAU               | Level-1-260C-UNLIM   | -40 to 85    | PH424                   |         |

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
