

1.8-V to 5-V DUAL UART WITH 64-BYTE FIFOS

FEATURES

- Larger FIFOs Reduce CPU Overhead
- Programmable Auto-RTS and Auto-CTS
- In Auto-CTS Mode, CTS Controls the Transmitter
- In Auto-RTS Mode, RCV FIFO Contents, and Threshold Control RTS
- Serial and Modem Control Outputs Drive a RJ11 Cable Directly When Equipment is on the Same Power Drop
- Capable of Running With All Existing TL16C450 Software
- After Reset, All Registers Are Identical to the TL16C450 Register Set
- Up to 48-MHz Clock Rate for up to 3-Mbps (Standard 16× Sampling) Operation, or up to 6-Mbps (Optional 8× Sampling) Operation With $V_{CC} = 5\text{ V}$ Nominal
- Up to 32-MHz Clock Rate for up to 2-Mbps (Standard 16× Sampling) Operation, or up to 4-Mbps (Optional 8× Sampling) Operation With $V_{CC} = 3.3\text{ V}$ Nominal
- Up to 24-MHz Clock Rate for up to 1.5-Mbps (Standard 16× Sampling) Operation, or up to 3-Mbps (Optional 8× Sampling) Operation With $V_{CC} = 2.5\text{ V}$ Nominal
- Up to 16-MHz Clock Rate for up to 1-Mbps (Standard 16× Sampling) Operation, or up to 2-Mbps (Optional 8× Sampling) Operation With $V_{CC} = 1.8\text{ V}$ Nominal
- In TL16C450 Mode, Hold and Shift Registers Eliminate the Need for Precise Synchronization Between the CPU and Serial Data
- Programmable Baud-Rate Generator Allows Division of Any Input Reference Clock by 1 to $(2^{16} - 1)$ and Generates an Internal 16× Clock
- Standard Asynchronous Communication Bits (Start, Stop, and Parity) Added to or Deleted From the Serial Data Stream
- 5-V, 3.3-V, 2.5-V, and 1.8-V Operation
- Independent Receiver Clock Input
- Transmit, Receive, Line Status, and Data Set Interrupts Independently Controlled
- Fully Programmable Serial Interface Characteristics
 - 5-, 6-, 7-, or 8-Bit Characters
 - Even-, Odd-, or No-Parity Bit Generation and Detection
 - 1-, 1 = -, or 2-Stop Bit Generation
 - Baud Generation (DC to 1 Mbit/s)
- False-Start Bit Detection
- Complete Status Reporting Capabilities
- 3-State Output TTL Drive Capabilities for Bidirectional Data Bus and Control Bus
- Line Break Generation and Detection
- Internal Diagnostic Capabilities
 - Loopback Controls for Communications Link Fault Isolation
 - Break, Parity, Overrun, and Framing Error Simulation
- Fully Prioritized Interrupt System Controls
- Modem Control Functions (CTS, RTS, DSR, DTR, RI, and DCD)
- Available in 44-Pin PLCC (FN) or 32-Pin QFN (RHB) Packages
- Each UART's Internal Register Set May Be Written Concurrently to Save Setup Time
- Multifunction (MF) Output Allows Users to Select Among Several Functions, Saving Package Pins

APPLICATIONS

- Point-of-Sale Terminals
- Gaming Terminals
- Portable Applications
- Router Control
- Cellular Data
- Factory Automation

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

DESCRIPTION

The TL16C2752 is a speed and functional upgrade of the TL16C2552. Since they are pinout and software compatible, designs can easily migrate from the TL16C2552 to the TL16C2752 if needed. The additional functionality within the TL16C2752 is accessed via an extended register set. Some of the key new features are larger receive and transmit FIFOs, embedded IrDA encoders and decoders, RS-485 transceiver controls, software flow control (Xon/Xoff) modes, programmable transmit FIFO thresholds, extended receive and transmit threshold levels for interrupts, and extended receive threshold levels for flow control halt/resume operation.

The TL16C2752 is a dual universal asynchronous receiver and transmitter (UART). It incorporates the functionality of two independent UARTs: each UART having its own register set and transmit and receive FIFOs. The two UARTs share only the data bus interface and clock source, otherwise they operate independently. Another name for the UART function is asynchronous communications element (ACE), and these terms will be used interchangeably. The bulk of this document describes the behavior of each ACE, with the understanding that two such devices are incorporated into the TL16C2752.

Functionally equivalent to the TL16C450 on power up or reset (single character or TL16C450 mode), each ACE can be placed in an alternate FIFO mode. This relieves the CPU of excessive software overhead by buffering received and to-be-transmitted characters. Each receiver and transmitter store up to 64 bytes in their respective FIFOs, with the receive FIFO including three additional bits per byte for error status. In the FIFO mode, selectable hardware or software autoflow control features can significantly reduce program overload and increase system efficiency by automatically controlling serial data flow.

Each ACE performs serial-to-parallel conversions on data received from a peripheral device or modem and stores the parallel data in its receive buffer or FIFO, and each ACE performs parallel-to-serial conversions on data sent from its CPU after storing the parallel data in its transmit buffer or FIFO. The CPU can read the status of either ACE at any time. Each ACE includes complete modem control capability and a processor interrupt system that can be tailored to the application.

Each ACE includes a programmable baud rate generator capable of dividing a reference clock with divisors of from 1 to 65535, thus producing a 16x or 8x internal reference clock for the transmitter and receiver logic. Each ACE accommodates up to a 3-Mbaud serial data rate (48-MHz input clock). As a reference point, that speed would generate a 333-ns bit time and a 3.33- μ s character time (for 8,N,1 serial data), with the internal clock running at 48 MHz and 16x sampling.

Each ACE has a $\overline{\text{TXRDY}}$ and $\overline{\text{RXRDY}}$ (via $\overline{\text{MF}}$) output that can be used to interface to a DMA controller.

TL16C2752 Block Diagram

A. \overline{MF} output allows selection of \overline{OP} , $\overline{BAUDOUT}$, or \overline{RXRDY} per channel.

TERMINAL FUNCTIONS

TERMINAL			I/O	DESCRIPTION
NAME	FN NO.	RHB NO.		
A0	10	3	I	Address 0 select bit. Internal registers address selection.
A1	14	6	I	Address 1 select bit. Internal registers address selection.
A2	15	7	I	Address 2 select bit. Internal registers address selection.
\overline{CDA} , \overline{CDB}	42, 30	—	I	Carrier detect (active low). These inputs are associated with individual UART channels A and B. A low on these pins indicates that a carrier has been detected by the modem for that channel. The state of these inputs is reflected in the modem status register (MSR). These inputs should be pulled high if unused.
CHSEL	16	8	I	Channel select. UART channel A or B is selected by the state of this pin when \overline{CS} is a logic 0. A logic 0 on the CHSEL selects the UART channel B, while a logic 1 selects UART channel A. CHSEL could just be an address line from the user CPU such as A3. Bit 0 of the alternate function register (AFR) can temporarily override CHSEL function, allowing the user to write to both channel register simultaneously with one write cycle when \overline{CS} is low. It is especially useful during the initialization routine.
\overline{CS}	18	10	I	UART chip select (active low). This pin selects channel A or B in accordance with the state of the CHSEL pin. This allows data to be transferred between the user CPU and the TL16C2752.
\overline{CTSA} , \overline{CTSB}	40, 28	25, 17	I	Clear to send (active low). These inputs are associated with individual UART channels A and B. A logic low on the CTS pins indicates the modem or data set is ready to accept transmit data from the TL16C2752. Status can be tested by reading MSR bit 4. These pins only affect the transmit and receive operations when auto CTS function is enabled through the enhanced feature register (EFR) bit 7, for hardware flow control operation. These inputs should be pulled high if unused.
D0–D4 D5–D7	2–6 7–9	27–31 32, 1, 2	I/O	Data bus (bidirectional). These pins are the 8-bit, 3-state data bus for transferring information to or from the controlling CPU. D0 is the least significant bit (LSB) and the first data bit in a transmit or receive serial data stream.
\overline{DSRA} , \overline{DSRB}	41, 29	—	I	Data set ready (active low). These inputs are associated with individual UART channels A and B. A logic low on these pins indicates the modem or data set is powered on and is ready for data exchange with the UART. The state of these inputs is reflected in the modem status register (MSR). These inputs should be pulled high if unused.
\overline{DTRA} , \overline{DTRB}	37, 27	—	O	Data terminal ready (active low). These outputs are associated with individual UART channels A and B. A logic low on these pins indicates that the TL16C2752 is powered on and ready. These pins can be controlled through the modem control register. Writing a 1 to MCR bit 0 sets the \overline{DTR} output to low, enabling the modem. The output of these pins is high after writing a 0 to MCR bit 0, or after a reset.
GND	12, 22	20		Signal and power ground
INTA, INTB	34, 17	21, 9	O	Interrupt A and B (active high). These pins provide individual channel interrupts, INTA and INTB. INTA and INTB are enabled when MCR bit 3 is set to a logic 1, interrupt sources are enabled in the interrupt enable register (IER). Interrupt conditions include receiver errors, available receiver buffer data, available transmit buffer space, or when a modem status flag is detected. INTA and INTB are in the high-impedance state after reset.
\overline{IOR}	24	14	I	Read input (active-low strobe). A high-to-low transition on \overline{IOR} loads the contents of an internal register defined by address bits A0–A2 onto the TL16C2752 data bus (D0–D7) for access by an external CPU.
\overline{IOW}	20	11	I	Write input (active-low strobe). A low-to-high transition on \overline{IOW} transfers the contents of the data bus (D0–D7) from the external CPU to an internal register that is defined by address bits A0–A2 and \overline{CSA} and \overline{CSB} .
NC	—	18, 19		No internal connection
\overline{MFA} , \overline{MFB}	35, 19	—	O	Multifunction. This output pin can function as the \overline{OP} , $\overline{BAUDOUT}$, or \overline{RXRDY} pin. One of these output signal functions can be selected by the user-programmable bits 1–2 of the alternate function register (AFR). These signal functions are described as follows: <ol style="list-style-type: none"> \overline{OP}—When \overline{OP} (active low) is selected, the \overline{MF} pin is a logic 0 when MCR bit 3 is set to a logic 1 (see MCR bit 3). MCR bit 3 defaults to a logic 1 condition after a reset or powerup. $\overline{BAUDOUT}$—When $\overline{BAUDOUT}$ function is selected, the 16x baud rate clock output is available at this pin. \overline{RXRDY}—\overline{RXRDY} (active low) is intended for monitoring DMA data transfers. If it is not used, leave it unconnected.

TERMINAL FUNCTIONS (continued)

TERMINAL			I/O	DESCRIPTION
NAME	FN NO.	RHB NO.		
RESET	21	12	I	Reset. RESET will reset the internal registers and all the outputs. The UART transmitter output and the receiver input are disabled during reset time. See TL16C2752 external reset conditions for initialization details. RESET is an active-high input.
$\overline{\text{RIA}}$, $\overline{\text{RIB}}$	43, 31	–	I	Ring indicator (active low). These inputs are associated with individual UART channels A and B. A logic low on these pins indicates the modem has received a ringing signal from the telephone line. A low-to-high transition on these input pins generates a modem status interrupt, if enabled. The state of these inputs is reflected in the modem status register (MSR). These inputs should be pulled high if unused.
$\overline{\text{RTSA}}$, $\overline{\text{RTSB}}$	36, 23	22, 13	O	Request to send (active low). These outputs are associated with individual UART channels A and B. A low on the $\overline{\text{RTS}}$ pin indicates the transmitter has data ready and waiting to send. Writing a 1 in the modem control register (MCR bit 1) sets these pins to low, indicating data is available. After a reset, these pins are set to high. These pins only affects the transmit and receive operation when auto $\overline{\text{RTS}}$ function is enabled through the enhanced feature register (EFR) bit 6, for hardware flow control operation.
RXA, RXB	39, 25	24, 15	I	Receive data input. These inputs are associated with individual serial channel data to the TL16C2752. During the local loopback mode, these RX input pins are disabled and TX data is internally connected to the UART RX input internally.
TXA, TXB	38, 26	23, 16	O	Transmit data. These outputs are associated with individual serial transmit channel data from the TL16C2752. During the local loopback mode, the TX input pin is disabled and TX data is internally connected to the UART RX input.
$\overline{\text{TXRDYA}}$, $\overline{\text{TXRDYB}}$	1, 32	–	O	Transmit ready (active low). $\overline{\text{TXRDY}}$ A and B go low when there are at least a trigger-level number of spaces available. They go high when the TX buffer is full.
V _{CC}	33, 44	26	I	Power-supply inputs
XTAL1	11	4	I	Crystal or external clock. XTAL1 functions as a crystal input or as an external clock input. A crystal can be connected between XTAL1 and XTAL2 to form an internal oscillator circuit (see Figure 4). Alternatively, an external clock can be connected to XTAL1 to provide custom data rates.
XTAL2	13	5	O	Crystal oscillator or buffered clock (see also XTAL1). XTAL2 is used as a crystal oscillator output or buffered a clock output.

Detailed Description

Hardware Autoflow Control (see Figure 1)

Hardware autoflow control is comprised of auto- $\overline{\text{CTS}}$ and auto- $\overline{\text{RTS}}$. With auto- $\overline{\text{CTS}}$, the $\overline{\text{CTS}}$ input must be active before the transmitter FIFO can emit data. With auto- $\overline{\text{RTS}}$, $\overline{\text{RTS}}$ becomes active when the receiver needs more data and notifies the sending serial device. When $\overline{\text{RTS}}$ is connected to $\overline{\text{CTS}}$, data transmission does not occur unless the receiver FIFO has space for the data; thus, overrun errors are eliminated using ACE1 and ACE2 from a TLC16C2752 with the autoflow control enabled. If not, overrun errors can occur when the transmit data rate exceeds the receiver FIFO read latency.

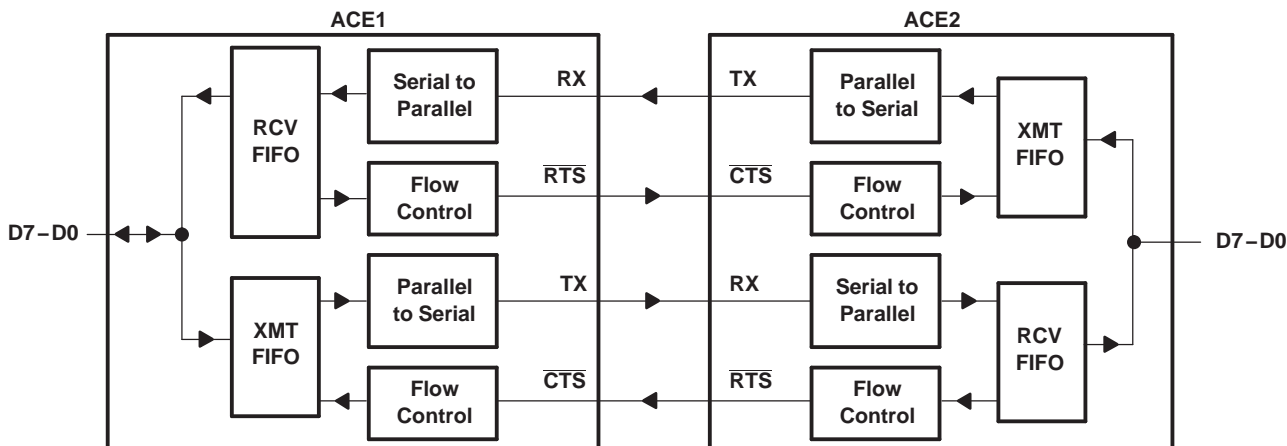

Figure 1. Autoflow Control (Auto- $\overline{\text{RTS}}$ and Auto- $\overline{\text{CTS}}$) Example

Auto-RTS

Auto-RTS data flow control originates in the receiver timing and control block (see Figure 4) and is linked to the programmed receiver FIFO trigger level. When the receiver FIFO level reaches the defined halt trigger level 8 (see Figure 3), RTS is deasserted. The sending ACE may send an additional byte after the trigger level is reached (assuming the sending ACE has another byte to send) because it may not recognize the deassertion of RTS until after it has begun sending the additional byte. RTS is automatically reasserted once the defined resume trigger level is reached.

Auto-CTS

The transmitter circuitry checks CTS before sending the next data byte. When CTS is active, it sends the next byte. To stop the transmitter from sending the following byte, CTS must be released before the middle of the last stop bit that is currently being sent (see Figure 2). The auto-CTS function reduces interrupts to the host system. When flow control is enabled, CTS level changes do not trigger host interrupts because the device automatically controls its own transmitter. Without auto-CTS, the transmitter sends any data present in the transmit FIFO and a receiver overrun error may result.

Auto-RTS and Auto-CTS Functional Timing

Figure 2. RTS Functional Timing Waveforms

Figure 3. CTS Functional Timing Waveforms

Figure 4. Functional Block Diagram

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT	
V _{CC}	Supply voltage range ⁽²⁾	–0.5	7	V	
V _I	Input voltage range at any input	–0.5	7	V	
V _O	Output voltage range	–0.5	7	V	
T _A	Operating free-air temperature range	TL16C2752	0	70	°C
		TL16C2752I	–40	85	
T _{stg}	Storage temperature range	–65	150	°C	
Lead temperature 1,6 mm (1/16 inch) from case for 10 s			260	°C	

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS}.

RECOMMENDED OPERATING CONDITIONS
1.8 V = 10%

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage	1.62	1.8	1.98	V
V _I	Input voltage	0		V _{CC}	V
V _{IH}	High-level input voltage	1.4		1.98	V
V _{IL}	Low-level input voltage	–0.3		0.4	V
V _O	Output voltage	0		V _{CC}	V
I _{OH}	High-level output current (all outputs)			0.5	mA
I _{OL}	Low-level output current (all outputs)			1	mA
Oscillator/clock speed				10	MHz

RECOMMENDED OPERATING CONDITIONS
2.5 V = 10%

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage	2.25	2.5	2.75	V
V _I	Input voltage	0		V _{CC}	V
V _{IH}	High-level input voltage	1.8		2.75	V
V _{IL}	Low-level input voltage	–0.3		0.6	V
V _O	Output voltage	0		V _{CC}	V
I _{OH}	High-level output current (all outputs)			1	mA
I _{OL}	Low-level output current (all outputs)			2	mA
Oscillator/clock speed				16	MHz

RECOMMENDED OPERATING CONDITIONS**3.3 V = 10%**

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	3	3.3	3.6	V
V_I	Input voltage	0		V_{CC}	V
V_{IH}	High-level input voltage	$0.7 \times V_{CC}$			V
V_{IL}	Low-level input voltage			$0.3 \times V_{CC}$	V
V_O	Output voltage	0		V_{CC}	V
I_{OH}	High-level output current (all outputs)			1.8	mA
I_{OL}	Low-level output current (all outputs)			3.2	mA
	Oscillator/clock speed			20	MHz

RECOMMENDED OPERATING CONDITIONS**5 V = 10%**

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	4.5	5	5.5	V
V_I	Input voltage	0		V_{CC}	V
V_{IH}	High-level input voltage	All except XTAL1, XTAL2	2		V
		XTAL1, XTAL2	$0.7 \times V_{CC}$		
V_{IL}	Low-level input voltage	All except XTAL1, XTAL2		0.8	V
		XTAL1, XTAL2		$0.3 \times V_{CC}$	
V_O	Output voltage	0		V_{CC}	V
I_{OH}	High-level output current (all outputs)			4	mA
I_{OL}	Low-level output current (all outputs)			4	mA
	Oscillator/clock speed			24	MHz

ELECTRICAL CHARACTERISTICS**1.8 V Nominal**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
V_{OH}	High-level output voltage ⁽²⁾ $I_{OH} = -0.5$ mA	1.3			V
V_{OL}	Low-level output voltage ⁽²⁾ $I_{OL} = 1$ mA			0.5	V
I_I	Input current $V_{CC} = 1.98$ V, $V_{SS} = 0$, $V_I = 0$ to 1.98 V, All other terminals floating			10	= A
I_{OZ}	High-impedance-state output current $V_{CC} = 1.98$ V, $V_{SS} = 0$, $V_I = 0$ to 1.98 V, Chip selected in write mode or chip deselected			± 20	= A
I_{CC}	Supply current $V_{CC} = 1.98$ V, $T_A = 0^\circ\text{C}$, RXA, RXB, DSRA, DSRB, CDA, CDB, CTSA, CTSB, RIA, and RIB at 1.4 V, All other inputs at 0.4 V, XTAL1 at 16 MHz, No load on outputs				mA
$C_{i(\text{CLK})}$	Clock input impedance		15	20	pF
$C_{o(\text{CLK})}$	Clock output impedance $V_{CC} = 0$, $V_{SS} = 0$, $f = 1$ MHz, $T_A = 25^\circ\text{C}$, All other terminals grounded		20	30	pF
C_I	Input impedance		6	10	pF
C_O	Output impedance		10	20	pF

(1) All typical values are at $V_{CC} = 1.8$ V and $T_A = 25^\circ\text{C}$.

(2) These parameters apply for all outputs except XTAL2.

ELECTRICAL CHARACTERISTICS

2.5 V Nominal

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
V _{OH}	High-level output voltage ⁽²⁾	I _{OH} = –1 mA	1.8			V
V _{OL}	Low-level output voltage ⁽²⁾	I _{OL} = 2 mA			0.5	V
I _I	Input current	V _{CC} = 2.75 V, V _{SS} = 0, V _I = 0 to 2.75 V, All other terminals floating			10	= A
I _{OZ}	High-impedance-state output current	V _{CC} = 2.75 V, V _{SS} = 0, V _I = 0 to 2.75 V, Chip selected in write mode or chip deselected			±20	= A
I _{CC}	Supply current	V _{CC} = 2.75 V, T _A = 0°C, RXA, RXB, DSRA, DSRB, CDA, CDB, CTSA, CTSB, RIA, and RIB at 1.8 V, All other inputs at 0.6 V, XTAL1 at 24 MHz, No load on outputs				mA
C _{I(CLK)}	Clock input impedance			15	20	pF
C _{O(CLK)}	Clock output impedance	V _{CC} = 0, V _{SS} = 0, f = 1 MHz, T _A = 25°C, All other terminals grounded		20	30	pF
C _I	Input impedance			6	10	pF
C _O	Output impedance			10	20	pF

(1) All typical values are at V_{CC} = 2.5 V and T_A = 25°C.

(2) These parameters apply for all outputs except XTAL2.

ELECTRICAL CHARACTERISTICS

3.3 V Nominal

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
V _{OH}	High-level output voltage ⁽²⁾	I _{OH} = –1.8 mA	2.4			V
V _{OL}	Low-level output voltage ⁽²⁾	I _{OL} = 3.2 mA			0.5	V

RECEIVER SWITCHING CHARACTERISTICS⁽¹⁾

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER	ALT. SYMBOL	FIGURE	TEST CONDITIONS	LIMITS								UNIT	
				1.8 V		2.5 V		3.3 V		5 V			
				MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX		
t_{d12}	Delay time, RCLK to sample	t_{SCD}	9		20		15		10		10		ns
t_{d13}	Delay time, stop to set INT or read RBR to LSI interrupt or stop to RXRDY↓	t_{SINT}	8, 9, 10, 11, 12		1		1		1		1		RCLK cycle
t_{d14}	Delay time, read RBR/LSR to reset INT	t_{RINT}	8, 9, 10, 11, 12	$C_L = 30$ pF		100		90		80		70	ns
t_{d26}	Delay time, RCV threshold byte to $\overline{\text{RTS}}\uparrow$		19	$C_L = 30$ pF								2	baudout cycles ⁽²⁾
t_{d27}	Delay time, read of last byte in receive FIFO to $\overline{\text{RTS}}\downarrow$		19	$C_L = 30$ pF								2	baudout cycles
t_{d28}	Delay time, first data bit of 16th character to $\overline{\text{RTS}}\uparrow$		20	$C_L = 30$ pF								2	baudout cycles
t_{d29}	Delay time, $\overline{\text{RBRRD}}$ low to $\overline{\text{RTS}}\downarrow$		20	$C_L = 30$ pF								2	baudout cycles

(1) In the FIFO mode, the read cycle (RC) = 1 baud clock (min) between reads of the receive FIFO and the status registers (interrupt identification register or line status register).

(2) A baudout cycle is equal to the period of the input clock divided by the programmed divider in DLL, DLM.

TRANSMITTER SWITCHING CHARACTERISTICS

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

APPLICATION INFORMATION

- A. Pin numbers shown are for 44-pin PLCC FN package.

Figure 19. Typical TL16C2752 Connection

PRINCIPLES OF OPERATION

UART Internal Registers

Each of the UART channel in the TL16C2752 has its own set of configuration registers selected by address lines A0, A1, and A2 with \overline{CS} and CHSEL selecting the channel. The complete register set is shown in [Table 1](#) and [Table 2](#).

Table 1. UART Channel A and B UART Internal Registers

ADDRESS A2–A0	RESET (HEX) VALUE	COMMENTS	REGISTER	READ/WRITE

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TL16C2752FN	ACTIVE	PLCC	FN	44	26	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	0 to 70	2752FN	Samples
TL16C2752IFN	ACTIVE	PLCC	FN	44	26	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	2752IFN	Samples
TL16C2752IFNR	ACTIVE	PLCC	FN	44	500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	2752IFN	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

MECHANICAL DATA

RHB (S-PVQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - QFN (Quad Flatpack No-Lead) Package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Falls within JEDEC MO-220.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
