

SLAS359 - DECEMBER 2001

PCM CODEC

FEATURES

- 2.7-V to 3.3-V Operation
- Designed for Analog and Digital Wireless Handsets and Telecommunications Applications
- Two Differential Microphone Inputs
- Differential Earphone Outputs and One Single-Ended Earphone Output
- Earphone and Microphone Mute
- Programmable Transmit, Receive, and Sidetone Paths With Extended Gain and Attenuation Ranges
- Programmable for 15-Bit Linear Data or 8-Bit Companded (μ-law and A-law) Mode
- Supports PCM Clock Rates of 128 kHz and 2.048 MHz
- Pulse Density Modulated (PDM) Buzzer Output
- On-Chip I²C Bus, Which Provides Simple, Standard, Two-Wire Serial Interface With Digital ICs
- Dual-Tone Multifrequency (DTMF) and Single-Tone Generator Capable of up to 8-kHz Tone With Three Selectable Resolutions of 7.8125 Hz, 15.625 Hz, and 31.25 Hz
- 2-Channel Auxiliary Multiplexer (MUX) (Analog Switch)[†]

- Capable of Driving 32 Ω Down to a 8-Ω
 Speaker
- Programmable Power Down Modes
- Pin Compatible to the TLV320AlC1103 and TLV320AlC1109 Devices for TQFP Only
- Available in a 32-Pin Thin Quad Flatpack (TQFP) Package and MicroStar Junior™ BGA

APPLICATIONS

- Digital Handset
- Digital Headset
- Cordless Phones
- Digital PABX
- Digital Voice Recording

DESCRIPTION

The TLV320AlC1110 provides extended gain and attenuation flexibility for transmit, receive, and sidetone paths. A differential earphone output is capable of driving speaker loads as low as 8 Ω for use in speaker phone applications. The single tone function on the TLV320AlC1110 generates a single tone output of up to 8 kHz. The resolution of the DTMF tone is also selectable to 7.8125 Hz, 15.625 Hz, or 31.25 Hz through the interface control. The analog switch provides more control capabilities for voice-band audio processor (PCM codec).

This device contains circuits to protect its inputs and outputs against damage due to high static voltages or electrostatic fields. These circuits have been qualified to protect this device against electrostatic discharges (ESD) of up to 2 kV according to MIL-STD-883C, Method 3015; however, it is advised that precautions be taken to avoid application of any voltage higher than maximum-rated voltages to these high-impedance circuits. During storage or handling, the device leads should be shorted together or the device should be placed in conductive foam. In a circuit, unused inputs should always be connected to an appropriated logic voltage level, preferably either V_{CC} or ground. Specific guidelines for handling devices of this type are contained in the publication *Guidelines for Handling Electrostatic-Discharge-Sensitive (ESDS) Devices and Assemblies* available from Texas Instruments.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

†These options are available on some devices. Please see the table of comparison for the last two generations of PCM codecs. MicroStar Junior is a trademark of Texas Instruments.

DESCRIPTION (Continued)

The PCM codec is an analog-digital interface for voice band signals designed with a combination of coders and decoders (codecs) and filters. It is a low-power device with companding options and programming features, and it meets the requirements for communication systems, including the cellular phone. The device operates in either the 15-bit linear or 8-bit companded (μ -law or A-Law) mode, which is selectable through the I²C interface.

A coder, an analog-to-digital converter or ADC, digitizes the analog voice signal, and a decoder, a digital-to-analog converter or DAC, converts the digital-voice signal to an analog output. The PCM codec provides a companding option to overcome the bandwidth limitations of telephone networks without degrading the sound quality. The human auditory system is a logarithmic system in which high amplitude signals require less resolution than low amplitude signals. Therefore, an 8-bit code word with nonuniform quantization (μ -law or A-law) has the same quality as 13-bit linear coding. The PCM codec provides better digital code words by generating a 15-bit linear coding option.

The human voice is effective from a frequency range of 300 Hz to 3300 Hz in telephony applications. In order to eliminate unwanted signals, the PCM codec design has two types of filters that operate in both the transmit and receive path. A low-pass filter attenuates the signals over 4 kHz. A selectable high-pass filter cleans up the signals under 100 Hz. This reduces noise that may have coupled in from 50/60-Hz power cables. The high-pass filter is bypassed by selecting the corresponding register bit.

The PCM codec has many programming features that are controlled using a 2-wire standard serial I²C interface. This allows the device to interface with many digital ICs such as a DSP or a microprocessor. The device has seven registers: power control, mode control, transmit PGA, receive PGA, high DTMF, low DTMF, and auxiliary mode control. Some of the programmable features that can be controlled by I²C interface include:

- Transmit amplifier gain
- Receive amplifier gain
- Sidetone gain
- Volume control
- Earphone control
- PLL power control
- Microphone selection
- Transmit channel high-pass filter control
- Receive channel high-pass filter control
- Companding options and selection control
- PCM loopback
- DTMF control
- Pulse density modulated control

The PCM codec is also capable of generating its own internal clocks from a 2.048-MHz master clock input.

detailed description

power on/reset

The power for the various digital and analog circuits is separated to improve the noise performance of the device. An external reset must be applied to the active low RESET terminal to assure reset upon power on and to bring the device to an operational state. After the initial power-on sequence, the device can be functionally powered up and powered down by writing to the power control register through the I²C interface. The device has a pin-selectable power up in the default mode option. The hardwired pin-selectable PWRUPSEL function allows the PCM codec to power up in the default mode and to be used without a microcontroller.

reference

A precision band gap reference voltage is generated internally and supplies all required voltage references to operate the transmit and receive channels. The reference system also supplies bias voltage for use with an electret microphone at terminal MBIAS. An external precision resistor is required for reference current setting at terminal REXT.

I²C control interface

The I²C interface is a two-wire bidirectional serial interface. The I²C interface controls the PCM codec by writing data to seven control registers:

- Power control
- Mode control
- Transmit PGA and sidetone control
- Receive PGA gain and volume control
- DTMF routing
- Tone selection control
- Auxiliary control

There are two power-up modes which may be selected at the PWRUPSEL terminal: (1) The PWRUPSEL state (V_{DD} at terminal 20) causes the device to power up in the default mode when power is applied. Without an I^2C interface or controlling device, the programmable functions are fixed at the default gain levels, and functions such as the sidetone and DTMF are not accessible. (2) The PWRUPSEL state (ground at terminal 20) causes the device to go to a power-down state when power is applied. In this mode, an I^2C interface is required to power up the device.

phase-locked loop (PLL)

The phase-lock loop generates the internal clock frequency required for digital filters and modulators by phase locking to 2.048-MHz master clock input.

PCM interface

The PCM interface transmits and receives data at the PCMO and PCMI terminals respectively. The data is transmitted or received at the PCMCLK speed once every PCMSYN cycle. The PCMCLK can be tied directly to the 128-kHz or 2.048-MHz master clock (MCLK). The PCMSYN can be driven by an external source or derived from the master clock and used as an interrupt to the host controller.

microphone amplifiers

The microphone input is a switchable interface for two differential microphone inputs. The first stage is a low-noise differential amplifier that provides a gain of 23.5 dB. The second-stage amplifier has a selectable gain of 6 dB or 18 dB.

detailed description (continued)

analog modulator

The transmit channel modulator is a third-order sigma-delta design.

transmit filter and PGA

The transmit filter is a digital filter designed to meet CCITT G.714 requirements. The device operates either in the 15-bit linear or 8-bit companded μ -law or in the A-law mode, which is selectable through the I²C interface. The transmit PGA defaults to 0 dB.

sidetone

A portion of the transmitted audio is attenuated and fed back to the receive channel through the sidetone path. The sidetone path defaults to the mute condition. The default gain of -12 dB is set in the sidetone control register. The sidetone path can be enabled by writing to the power control register.

receive volume control

The receive volume control block acts as an attenuator with a range of –18 dB to 0 dB in 2-dB steps for control of the receive channel volume. The receive volume control gain defaults to 0 dB.

receive filter and PGA

The receive filter is a digital filter that meets CCITT G.714 requirements with a high-pass filter that is selectable through the I^2C interface. The device operates either in the 15-bit linear or the 8-bit μ -law or the A-law companded mode, which is selectable through the I^2C interface. The gain defaults to -4 dB, representing a 3-dBm level for a 32- Ω load impedance and the corresponding digital full scale PCMI code.

digital modulator and filter

The second-order digital modulator and filter convert the received digital PCM data to the analog output required by the earphone interface.

earphone amplifiers

The analog signal can be routed to either of two earphone amplifiers, one with differential output (EAR1ON and EAR1OP) and one with single-ended output (EAR2O). Clicks and pops are suppressed for EAR1 differential output only.

tone generator

The tone generator provides generation of standard DTMF tones which are output to (1) the buzzer driver, as a PDM signal, (2) the receive path DAC for outputting through the earphone, or (3) as PCMO data. The integer value is loaded into one of two 8-bit registers, the high-tone register (04), or the low-tone register (05) (see the *Register Map Addressing* section). The tone output is 2 dB higher when applied to the high tone register (04). The high DTMF tones must be applied to the high-tone register, and the low DTMF tones to the low-tone register. The tone signals can be generated with three different resolutions at $\Delta F = 7.8125$ Hz, 15.625 Hz, and 31.250 Hz. The resolution option can be selected by setting the register (06).

analog mux

The analog switch can be used to source an analog signal to two different loads. The output can be reselected by setting the auxiliary register (06).

detailed description (continued)

DTMF gain MUX

The DTMF gain MUX selects the signal path and applies the appropriate gain setting. Therefore the device is either in tone mode or in voice mode. When set in the voice mode, the gain is controlled by the auxiliary register and is set to 0 dB or 6 dB. When set in the tone mode, the gain is from –12 dB to 12 dB in 6-dB steps which is set by the volume control register. The gain setting is controlled by the RXPGA register. This will not create any control contention since the device is working in one mode at a time.

[†] All MicroStar Junior BGA™ pins that are not mentioned have no internal connection.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, AV _{DD} , DV _{DD} , PLLV _{DD} , EARV _{DD}	
Output voltage range, V _O	–0.5 V to 3.6 V
Input voltage range, V _I	
Continuous total power dissipation	See Dissipation Rating Table
Operating free air temperature range (industrial temperature)	40°C to 85°C
Storage temperature range, testing	–65°C to 150°C
Lead temperature 1.6 mm from case for 10 seconds	

[†] Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

DISSIPATION RATING TABLE

PACKAGE	T _A ≤ 25°C POWER RATING	DERATING FACTOR ABOVE T _A = 25°C	T _A = 85°C POWER RATING	COMMENTS
TQFP	702 mW	7.2 mW/°C	270 mW	Low dissipation printed circuit board (PCB)
MicroStar Junior BGA	660 mW	164 mW/°C	220 mW	Low dissipation PCB
MicroStar Junior BGA	2.75 W	36 mW/°C	917 mW	High dissipation PCB

recommended operating conditions (see Notes 1 and 2)

	MIN	NOM	MAX	UNIT
Supply voltage, AV _{DD} , DV _{DD} , PLLV _{DD} , EARV _{DD}	2.7		3.3	V
High-level input voltage, V _{IH}	$0.7 \times V_{DD}$			V
Low-level input voltage, V _{IL}			0.3xV_{DD}	V
Load impedance between EAR1OP and EAR1ON-RL		8 to 32		Ω
Load impedance for EAR2OP-RL		32		Ω
Operating free-air temperature, TA	-40		85	°C

NOTES: 1. To avoid possible damage and resulting reliability problems to these CMOS devices, follow the *power-on initialization* paragraph, described in the *Principles of Operation*.

electrical characteristics over recommended ranges of supply voltage and free-air temperature (unless otherwise noted)

supply current

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
		Operating, EAR1 selected, MicBias disabled		4.5	6	mA
I _{DD} Supply current from V _{DD}	Operating, EAR2 selected, MicBias disabled		4.5	6	mA	
	Supply current from V _{DD}	Power down room temperature, V _{DD} = 3 V, Reg 6 bit 7 = 1, MClk not present (see Note 3)		2	10	μΑ
		Power down room temperature, V _{DD} = 3 V, , Reg 6 bit 7 = 0, MClk not present (see Note 3)		10	30	μΑ
ton(i)	Power-up time from power down			5	10	ms

NOTE 3: VIHMIN = VDD, VILMAX = VSS.

^{2.} Voltages are with respect to AVSS, DVSS, PLLVSS, and EARVSS.

SLAS359 - DECEMBER 2001

electrical characteristics over recommended ranges of supply voltage and free-air temperature (unless otherwise noted) (continued)

digital interface

PARAMETER		TEST COND	ITIONS	MIN	TYP	MAX	UNIT
VOH	High-level output voltage PCMO (BUZZCON)	$I_{OH} = -3.2 \text{ mA},$	V _{DD} = 3 V	DV _{DD} -0.25			V
V_{OL}	Low-level output voltage PCMO	$I_{OL} = 3.2 \text{ mA},$	V _{DD} = 3 V			0.25	V
lΗ	High-level input current, any digital input	$V_I = V_{DD}$				10	μΑ
Ι _Ι L	Low-level input current, any digital input	$V_I = V_{SS}$				10	μΑ
Ci	Input capacitance					10	pF
Co	Output capacitance					20	pF
RL	Load impedance (BUZZCON)					5	kΩ

microphone interface

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{IO}	Input offset voltage at MIC1N, MIC2N	See Note 4	-5		5	mV
I_{IB}	Input bias current at MIC1N, MIC2N		-300		300	nA
Ci	Input capacitance at MIC1N, MIC2N			5		pF
V _n	Microphone input referred noise, psophometrically weighted, (C-message weighted is similar)	MIC amp 1 gain = 23.5 dB MIC amp 2 gain = 0 dB		3	4.7	μV _{rms}
I _O max	Output source current—MBIAS		1		1.2	mA
V _(mbias)	Microphone bias supply voltage (see Note 5)		2.3	2.5	2.65	V
	MICMUTE		-80			dB
	Input impedance	Fully differential	35	60	100	kΩ

NOTES: 4. Measured while MIC1P and MIC1N are connected together. Less than 0.5-mV offset results in 0 value code on PCMOUT.

5. Not a JEDEC symbol.

speaker interface

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT

power-on initialization

An external reset with a minimum pulse width of 500 ns must be applied to the active low RESET terminal to assure reset upon power on. All registers are set with default values upon external reset initialization.

The desired selection for all programmable functions can be initialized prior to a power-up command using the control interface.

Table 1. Power-Up and Power-Down Procedures (V_{DD} = 2.7 V, earphone amplifier unloaded)

DEVICE STATUS	PROCEDURE	MAXIMUM POWER CONSUMPTION
B	Set bit 1 = 1 in power control register, EAR1 enabled	16.2 mW
Power up	Set bit 1 = 0 in power control register, EAR2 enabled	14.6 mW
	Set bit 7 = 1 in TXPGA control register and bit 0 = 0	1.35 μW
Power down	Set bit 7 = 0 in TXPGA control register and bit 0 = 0	67.5 μW

In addition to resetting the power down bit in the power control register, loss of MCLK (no transition detected) automatically enters the device into a power-down state with PCMO in the high impedance state. If during a pulse code modulation (PCM) data transmit cycle an asynchronous power down occurs, the PCM interface remains powered up until the PCM data is completely transferred.

An additional power-down mode overrides the MCLK detection function. This allows the device to enter the power down state without regard to MCLK. Setting bit 7 of the TXPGA sidetone register to logic high enables this function.

internal reference current setting terminal

Use a 100-k Ω precision resistor to connect the REXT pin to GND.

conversion laws

The device can be programmed for either a 15-bit linear or and 8-bit (μ -law or A-law) companding mode. The companding operation approximates the CCITT G.711 recommendation. The linear mode operation uses a 15-bit twos-complement format.

transmit operation

microphone input

The microphone input stage is a low-noise differential amplifier that provides a preamplifier gain of 23.5 dB. It is recommended that a microphone capacitively connected to the MIC1N and MIC1P inputs, while the MIC2N and MIC2P inputs can be used to capacitively connect a second microphone or an auxiliary audio circuit.

transmit operation (continued)

Figure 12. Typical Microphone Interface

microphone mute function

Transmit channel muting provides 80-dB attenuation of the input microphone signal. The MICMUTE function can be selected by setting bit 6 of the power control register through the I²C interface.

transmit channel gain control

The values in the transmit PGA control registers control the gain in the transmit path. The total TX channel gain can vary from 41.5 dB to 19.5 dB. The default total TX channel gain is 23.5 dB.

	BIT N	IAME		MIC AMP1	MIC AMP2	TX PGA	GAIN MODE	TOTAL TX GAIN

CD7-CD0 = data word in companded mode

LD14-LD0 = data word in linear mode

DTMF generator operation and interface

The DTMF circuit generates the summed DTMF tones for push button dialing and provides the PDM output for the BUZZCON user-alert tone. The integer value is determined by the formula round tone [Freq (Hz)/resolution (Hz)]. The integer value is loaded into one of two 8-bit registers, high-tone register (04) or low-tone register (05). The tone output is 2 dB higher when applied to the high-tone register (04). When generating DTMF tones, the high-frequency value must be applied to the high tone register (04) and the low DTMF value to the low-tone register.

The DTMF frequency resolution is controlled by the auxiliary register (06) bits 2, 3, 4, and 5. When the resolution is set to 7.8125 Hz, the frequency range can be up to 1992.2 Hz. A wider range can be accomplished (for example, 2x or 4x) by selecting lower resolutions of 15.625 Hz or 31.250 Hz. The gain setting is controlled by the RXPGA gain control. This register applies the required gain to obtain MUX control during tone mode operation. Table 3 shows the relationship of the two gain settings.

DTMF generator operation and interface (continued)

INTEGER TONE DT5 DT0 DT7 DT6 DT4 DT3 DT2 DT1 TONE/Hz **VALUE FUNCTION DTMF Low** DTMF Low DTMF Low DTMF Low DTMF HIgh DTMF HIgh DTMF HIgh DTMF HIgh

Table 7. Typical DTMF and Single Tone Control

Tones from the DTMF generator block are present at all outputs and are controlled by enabling or disabling the individual output ports. The values that determine the tone frequency are loaded into the tone registers (high and low) as two separate values.

The values loaded into the tone registers initiate an iterative table look-up function, placing a 6-bit or 7-bit in twos-complement value into the tone registers. There is a 2-dB difference in the resulting output of the two registers, the high-tone register having the greater result.

In the case of low-tone signal, the tone generator outputs a 6-bit integer with a maximum code of 31 (011111). However, the DTMF output is an 8-bit integer. Therefore, two zeros are padded to the MSB position, which results in 31 (00011111). On the other hand, the receive channel requires a 15-bit integer, the input 3968 (000111110000000). Since the maximum digital value of receive channel is 16383 (01111111111111), the maximum low-tone signal is designed to be -12.32 dB below the full digital scale.

$$20 \log \left(\frac{3968}{16383}\right)^2 = -12.32 \, dB \tag{1}$$

In the case of high-tone signal, the tone generator outputs a 7-bit integer with a maximum code of 39 (0100111). The DTMF, therefore, pads a zero to the MSB and generates an 8-bit integer (00100111). In order to send the digital code to receive channel, it is converted to a 15-bit integer with seven more zeros padded to LSB position and biased as 4992 (001001110000000). Therefore, the maximum high-tone signal is designed to be $-10.32~\mathrm{dB}$ below the full digital scale.

$$20 \log \left(\frac{4992}{16383}\right)^2 = -10.32 \, \mathrm{dB} \tag{2}$$

In the case of DTMF output, the tone generator outputs an 8-bit integer with the maximum code level of 70 (01000110). This output is converted to a 15-bit code with the value of 8960 (010001100000000). Therefore, the maximum output of DTMF is designed to be -5.24 dB below the full digital scale.

$$20 \log \left(\frac{8960}{16383}\right)^2 = -5.24 \, \mathrm{dB} \tag{3}$$

buzzer logic section

The single-ended output BUZZCON is a PDM signal intended to drive a buzzer through an external driver transistor. The PDM begins as a selected DTMF tone, generated and passed through the receive D/A channel and fed back to the transmit channel analog modulator, where a PDM signal is generated and routed to the BUZZCON output.

Figure 13. Buzzer Driver System Architecture

support section

The clock generator and control circuit use the master clock input (MCLK) to generate internal clocks to drive internal counters, filters, and convertors. Register control data is written into and read back from the PCM codec registers via the control interface.

I²C-bus protocols

The PCM codec serial interface is designed to be I²C bus-compatible and operates in the slave mode when CE is high. This interface consists of the following terminals:

SCL: I²C-bus serial clock. This input synchronizes the control data transfer to and from the codec.

SDA: I²C-bus serial address/data input/output. This is a bidirectional terminal that transfers register

control addresses and data into and out of the codec. It is an open drain terminal and therefore requires a pullup resistor to V_{CC} (typical 10 k Ω for 100 kHz).

TLV320AIC1110 has a fixed device select address of (E2)HEX for write mode and (E3)HEX for read mode.

For normal data transfer, SDA is allowed to change only when SCL is low. Changes when SCL is high are reserved for indicating the start and stop conditions.

Data transfer may be initiated only when the bus is not busy. During data transfer, the data line must remain stable whenever the clock line is at high. Changes in the data line while the clock line is at high are interpreted as a start or stop condition.

Table 8. I²C-Bus Conditions

CONDITION	STATUS	DESCRIPTION
Α	Bus not busy	Both data and clock lines remain at high.
В	Start data transfer	A high to low transition of the SDA line while the clock (SCL) is high determines a start condition. All commands must proceed from a start condition.
С	Stop data transfer	A low to high transition of the SDA line while the clock (SCL) is high determines a stop condition. All operations must end with a stop condition.
D	Data valid	The state of the data line represents valid data when, after a start condition, the data line is stable for the duration of the high period of the clock signal.

The data on the line must be changed during the low period of the clock signal. There is one clock pulse per bit of data.

I²C-bus protocols (continued)

Each data transfer is initiated with a start condition and terminated with a stop condition. The number of data bytes, transferred between the start and stop conditions, is determined by the master device (microprocessor).

When addressed, the PCM codec generates an acknowledge after the reception of each byte. The master device must generate an extra clock pulse that is associated with this acknowledge bit.

The PCM codec must pull down the SDA line during the acknowledge clock pulse so that the SDA line is at stable low state during the high period of the acknowledge related clock pulse. Setup and hold times must be taken into account. During read operations, the master device must signal an end of data to the slave by not generating an acknowledge bit on the last byte that was clocked out of the slave. In this case, the slave (PCM codec) must leave the data line high to enable the master device to generate the stop condition.

clock frequencies and sample rates

A fixed PCMSYN rate of 8 kHz determines the sampling rate.

using PCM codec as a general-purpose PCM codec

In situations when a general-purpose PCM codec is needed and programming features are not necessary, the receive and transmit channels can be enabled for voice mode only by setting the powerup select pin to V_{CC} level.

When set to default, the following features are activated:

- REF is powered up
- Ear amp1 selected, Ear amp 2 = OFF
- Receive channel enabled
- MIC bias enabled
- MIC 2 selected
- Transmit channel enabled
- Side tone enabled, Gain = -12 dB
- TX channel high pass filter disabled
- TX channel slope filter enabled
- RX channel HP filter disabled (low pass only)
- Buzzcon disabled
- Linear mode only
- TX and RX channel normal mode (no loopback)
- Tone mode disabled (voice mode only)
- MIC amp 1 gain = 23.5 dB
 MIC amp 2 gain = 6 dB
 TX PGA gain = 0 dB
 Total TX gain = 29.5 dB
- Receive PGA = -4 dB
 Receive PGA 2 = 0 dB
 Volume = 0 dB
 Total RX gain = -4 dB
- Clock = 2.048 MHz

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
