

TMP75B 1.8-V Digital Temperature Sensor with Two-Wire Interface and Alert

1 Features

- Low-Voltage Alternative to LM75 and TMP75
- Digital Output with Standard Two-Wire Serial Interface
- Up to 8 Pin-Programmable Bus Addresses
- Overtemperature ALERT Pin with Programmable Trip Values
- Shutdown Mode for Battery Power Saving
- One-Shot Conversion Mode for Custom Update Rates
- Operating Temperature Range: -55°C to $+125^{\circ}\text{C}$
- Operating Supply Range: 1.4 V to 3.6 V
- Quiescent Current:
 - 45 μA Active (typ)
 - 0.3 μA Shutdown (typ)
- Accuracy:
 - $\pm 0.5^{\circ}\text{C}$ (typ) from -20°C to $+85^{\circ}\text{C}$
 - $\pm 1^{\circ}\text{C}$ (typ) from -55°C to $+125^{\circ}\text{C}$
- Resolution: 12 Bits (0.0625 $^{\circ}\text{C}$)
- Packages: SOIC-8 and VSSOP-8

2 Applications

- Server and Computer Thermal Management
- Telecommunication Equipment
- Office Machines
- Video Game Consoles
- Set-Top Boxes
- Power Supply and Battery Thermal Protection
- Thermostat Control
- Environmental Monitoring and HVAC
- Electrical Motor Driver Thermal Protection

3 Description

The TMP75B is an integrated digital temperature sensor with a 12-bit analog-to-digital converter (ADC) that can operate at a 1.8-V supply, and is pin and register compatible with the industry-standard LM75 and TMP75. This device is available in SOIC-8 and VSSOP-8 packages, and requires no external components to sense the temperature. The TMP75B is capable of reading temperatures with a resolution of 0.0625 $^{\circ}\text{C}$ and is specified over a temperature range of -55°C to $+125^{\circ}\text{C}$.

The TMP75B features SMBus and two-wire interface compatibility, and allows up to eight devices on the same bus with the SMBus overtemperature alert function. The programmable temperature limits and the ALERT pin allow the sensor to operate as a stand-alone thermostat, or an overtemperature alarm for power throttling or system shutdown.

The factory-calibrated temperature accuracy and the noise-immune digital interface make the TMP75B the preferred solution for temperature compensation of other sensors and electronic components, without the need for additional system-level calibration or elaborate board layout for distributed temperature sensing.

The TMP75B is ideal for thermal management and protection of a variety of consumer, computer, communication, industrial, and environmental applications.

Device Information⁽¹⁾

DEVICE NAME	PACKAGE	BODY SIZE (NOM)
TMP75B	SOIC (8)	4.90 mm x 3.90 mm
	VSSOP (8)	3.00 mm x 3.00 mm

(1) For all available packages, see the package option addendum at the end of the datasheet.

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
A0	7	I	Address select. Connect to GND or V_S .
A1	6	I	Address select. Connect to GND or V_S .
A2	5	I	Address select. Connect to GND or V_S .
ALERT	3	O	Overtemperature alert. Open-drain output; requires a pull-up resistor.
GND	4	—	Ground.
SCL	2	I	Serial clock.
SDA	1	I/O	Serial data. Open-drain output; requires a pull-up resistor.
V_S	8	I	Supply voltage, 1.4 V to 3.6 V.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, V_S			4	V
Input voltage	SDA, SCL, ALERT, A2, A1	-0.3	4	V
	A0	-0.3	$(V_S) + 0.3$	V
Sink current	SDA, ALERT		10	mA
Operating junction temperature		-55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 Handling Ratings

			MIN	MAX	UNIT
T_{stg}	Storage temperature range		-60	150	°C
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	-2000	2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	-1000	1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage		1.4	1.8	3.6	V
Operating free-air temperature, T_A		-55		125	°C

7 Detailed Description

7.1 Overview

The TMP75B is a digital temperature sensor optimal for thermal management and thermal protection applications. The TMP75B is two-wire and SMBus interface compatible, and is specified over a temperature range of -55°C to $+125^{\circ}\text{C}$.

The temperature sensing device for the TMP75B is the chip itself. A bipolar junction transistor (BJT) inside the chip is used in a band-gap configuration to produce a voltage proportional to the chip temperature. The voltage is digitized and converted to a 12-bit temperature result in degrees Celsius, with a resolution of 0.0625°C . The package leads provide the primary thermal path because of the lower thermal resistance of the metal. Thus, the temperature result is equivalent to the local temperature of the printed circuit board (PCB) where the sensor is mounted.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Digital Temperature Output

The 12-bit digital output from each temperature measurement conversion is stored in the read-only temperature register. Two bytes must be read to obtain the data, as shown in [Figure 15](#). Note that byte 1 is the most significant byte, followed by byte 2, the least significant byte. The temperature result is left-justified with the 12 most significant bits used to indicate the temperature. There is no need to read the second byte if resolution below 1°C is not required. [Table 1](#) summarizes the temperature data format. One LSB equals 0.0625°C. Negative numbers are represented in binary twos complement format.

Table 1. Temperature Data Format⁽¹⁾

TEMPERATURE (°C)	DIGITAL OUTPUT	
	BINARY	HEX
128	0111 1111 1111	7FF
127.9375	0111 1111 1111	7FF
100	0110 0100 0000	640
80	0101 0000 0000	500
75	0100 1011 0000	4B0
50	0011 0010 0000	320
25	0001 1001 0000	190
0.25	0000 0000 0100	004
0	0000 0000 0000	000
-0.25	1111 1111 1100	FFC
-25	1110 0111 0000	E70
-55	1100 1001 0000	C90

(1) The temperature sensor resolution is 0.0625°C/LSB.

[Table 1](#) does not supply a full list of all temperatures. Use the following rules to obtain the digital data format for a given temperature, and vice versa.

To convert positive temperatures to a digital data format:

Divide the temperature by the resolution. Then, convert the result to binary code with a 12-bit, left-justified format, and MSB = 0 to denote a positive sign.

Example: $(+50^{\circ}\text{C}) / (0.0625^{\circ}\text{C} / \text{LSB}) = 800 = 320\text{h} = 0011\ 0010\ 0000$

To convert a positive digital data format to temperature:

Convert the 12-bit, left-justified binary temperature result, with the MSB = 0 to denote a positive sign, to a decimal number. Then, multiply the decimal number by the resolution to obtain the positive temperature.

Example: $0011\ 0010\ 0000 = 320\text{h} = 800 \times (0.0625^{\circ}\text{C} / \text{LSB}) = +50^{\circ}\text{C}$

To convert negative temperatures to a digital data format:

Divide the absolute value of the temperature by the resolution, and convert the result to binary code with a 12-bit, left-justified format. Then, generate the twos complement of the result by complementing the binary number and adding one. Denote a negative number with MSB = 1.

Example: $(|-25^{\circ}\text{C}|) / (0.0625^{\circ}\text{C} / \text{LSB}) = 400 = 190\text{h} = 0001\ 1001\ 0000$

Two's complement format: $1110\ 0110\ 1111 + 1 = 1110\ 0111\ 0000$

To convert a negative digital data format to temperature:

Generate the twos complement of the 12-bit, left-justified binary number of the temperature result (with MSB = 1, denoting negative temperature result) by complementing the binary number and adding one. This represents the binary number of the absolute value of the temperature. Convert to decimal number and multiply by the resolution to get the absolute temperature, then multiply by -1 for the negative sign.

Example: $1110\ 0111\ 0000$ has twos complement of $0001\ 1001\ 0000 = 0001\ 1000\ 1111 + 1$

Convert to temperature: $0001\ 1001\ 0000 = 190\text{h} = 400$; $400 \times (0.0625^{\circ}\text{C} / \text{LSB}) = 25^{\circ}\text{C} = (|-25^{\circ}\text{C}|)$; $(|-25^{\circ}\text{C}|) \times (-1) = -25^{\circ}\text{C}$

7.3.2 Temperature Limits and Alert

The temperature limits are stored in the T_{LOW} and T_{HIGH} registers (Table 8 and Table 9) in the same format as the temperature result, and their values are compared to the temperature result on every conversion. The outcome of the comparison drives the behavior of the ALERT pin, which can operate as a comparator output or an interrupt, and is set by the TM bit in the configuration register (Table 7).

In comparator mode (TM = 0, default), the ALERT pin becomes active when the temperature is equal to or exceeds the value in T_{HIGH} (fault conditions) for a consecutive number of conversions as set by the FQ bits of the configuration register. ALERT clears when the temperature falls below T_{LOW} for the same consecutive number of conversions. The difference between the two limits acts as a hysteresis on the comparator output, and a fault counter prevents false alerts as a result of environmental noise.

In interrupt mode (TM = 1), the ALERT pin becomes active when the temperature equals or exceeds the value in T_{HIGH} for a consecutive number of fault conditions. The ALERT pin remains active until a read operation of any register occurs, or the device successfully responds to the SMBus alert response address. The ALERT pin is also cleared if the device is placed in shutdown mode (see Shutdown Mode section for shutdown mode description). After the ALERT pin is cleared, this pin becomes active again only when the temperature falls below T_{LOW} for a consecutive number of fault conditions, and remains active until cleared by a read operation of any register, or a successful response to the SMBus alert response address. After the ALERT pin is cleared, the cycle repeats with the ALERT pin becoming active when the temperature equals or exceeds T_{HIGH} , and so on. The ALERT pin can also be cleared by resetting the device with the general-call reset command. This action also clears the state of the internal registers in the device and the fault counter memory, returning the device to comparator mode (TM = 0).

The active state of the ALERT pin is set by the POL bit in the configuration register. When POL = 0 (default), the ALERT pin is active low. When POL = 1, the ALERT pin is active high. The operation of the ALERT pin in various modes is illustrated in Figure 7.

Figure 7. ALERT Pin Modes of Operation

7.3.3 Serial Interface

The TMP75B operates as a slave device only on the two-wire bus and SMBus. Connections to the bus are made using the open-drain I/O lines, SDA and SCL. The SDA and SCL pins feature integrated spike-suppression filters and Schmitt triggers to minimize the effects of input spikes and bus noise. The TMP75B supports the transmission protocol for both fast (1 kHz to 400 kHz) and high-speed (1 kHz to 3 MHz) modes. All data bytes are transmitted MSB first.

7.3.3.1 Bus Overview

The device that initiates the transfer is called a *master*, and the devices controlled by the master are *slaves*. The bus must be controlled by a master device that generates the serial clock (SCL), controls the bus access, and generates the start and stop conditions.

To address a specific device, initiate a start condition by pulling the data line (SDA) from a high to a low logic level while SCL is high. All slaves on the bus shift in the slave address byte; the last bit indicates whether a read or write operation follows. During the ninth clock pulse, the slave being addressed responds to the master by generating an acknowledge bit and pulling SDA low.

Data transfer is then initiated and sent over eight clock pulses followed by an acknowledge bit. During data transfer, SDA must remain stable while SCL is high because any change in SDA while SCL is high is interpreted as a start or stop signal.

After all data have been transferred, the master generates a stop condition indicated by pulling SDA from low to high, while SCL is high.

7.3.3.2 Serial Bus Address

To communicate with the TMP75B, the master must first communicate with slave devices using a slave address byte. The slave address byte consists of seven address bits, and a direction bit indicating the intent of executing either a read or write operation. The TMP75B features three address pins that allow up to eight devices to be addressed on a single bus. The TMP75B latches the status of the address pins at the start of a communication. [Table 2](#) describes the pin logic levels and the corresponding address values.

Table 2. Address Pin Connections and Slave Addresses

DEVICE TWO-WIRE ADDRESS	A2	A1	A0
1001000	GND	GND	GND
1001001	GND	GND	V _S
1001010	GND	V _S	GND
1001011	GND	V _S	V _S
1001100	V _S	GND	GND
1001101	V _S	GND	V _S
1001110	V _S	V _S	GND
1001111	V _S	V _S	V _S

7.3.3.3 Writing and Reading Operation

Accessing a particular register on the TMP75B is accomplished by writing the appropriate value to the pointer register. The value for the pointer register is the first byte transferred after the slave address byte with the R/W bit low. Every write operation to the TMP75B requires a value for the pointer register (see [Figure 9](#)).

When reading from the TMP75B, the last value stored in the pointer register by a write operation is used to determine which register is read by a read operation. To change the register pointer for a read operation, a new value must be written to the pointer register. This action is accomplished by issuing a slave address byte with the R/W bit low, followed by the pointer register byte. No additional data are required. The master can then generate a start condition and send the slave address byte with the R/W bit high to initiate the read command. See [Figure 10](#) for details of this sequence. If repeated reads from the same register are desired, there is no need to continually send the pointer register bytes because the TMP75B stores the pointer register value until it is changed by the next write operation.

Note that register bytes are sent with the most significant byte first, followed by the least significant byte.

7.3.3.4 Slave-Mode Operations

The TMP75B can operate as a slave receiver or slave transmitter.

7.3.3.4.1 Slave Receiver Mode:

The first byte transmitted by the master is the slave address, with the $\overline{R/\overline{W}}$ bit low. The TMP75B then acknowledges reception of a valid address. The next byte transmitted by the master is the pointer register. The TMP75B then acknowledges reception of the pointer register byte. The next byte or bytes are written to the register addressed by the pointer register. The TMP75B acknowledges reception of each data byte. The master can terminate data transfer by generating a start or stop condition.

7.3.3.4.2 Slave Transmitter Mode:

The first byte transmitted by the master is the slave address, with the $\overline{R/\overline{W}}$ bit high. The slave acknowledges reception of a valid slave address. The next byte is transmitted by the slave and is the most significant byte of the register indicated by the pointer register. The master acknowledges reception of the data byte. The next byte transmitted by the slave is the least significant byte. The master acknowledges reception of the data byte. The master can terminate data transfer by generating a not-acknowledge bit on reception of any data byte, or by generating a start or stop condition.

7.3.3.5 SMBus Alert Function

The TMP75B supports the SMBus alert function. When the TMP75B operates in interrupt mode ($TM = 1$), the ALERT pin may be connected as an SMBus alert signal. When a master senses that an alert condition is present on the ALERT line, the master sends an SMBus alert command (00011001) to the bus. If the ALERT pin is active, the device acknowledges the SMBus alert command and responds by returning its slave address on the SDA line. The eighth bit (LSB) of the slave address byte indicates whether the alert condition is caused by the temperature exceeding T_{HIGH} or falling below T_{LOW} . The LSB is high if the temperature is greater than T_{HIGH} , or low if the temperature is less than T_{LOW} . See [Figure 11](#) for details of this sequence.

If multiple devices on the bus respond to the SMBus alert command, arbitration during the slave address portion of the SMBus alert command determines which device clears its alert status first. If the TMP75B wins the arbitration, its ALERT pin becomes inactive at the completion of the SMBus alert command. If the TMP75B loses the arbitration, its ALERT pin remains active.

7.3.3.6 General Call

The TMP75B responds to a two-wire general call address (0000000) if the eighth bit is 0. The device acknowledges the general call address and responds to commands in the second byte. If the second byte is 00000100, the TMP75B latches the status of the address pin, but does not reset. If the second byte is 00000110, the TMP75B internal registers are reset to power-up values.

7.3.3.7 High-Speed (Hs) Mode

In order for the two-wire bus to operate at frequencies above 400 kHz, the master device must issue an SMBus Hs-mode master code (00001xxx) as the first byte after a start condition to switch the bus to high-speed operation. The TMP75B does not acknowledge this byte, but does switch its input filters on SDA and SCL and its output filters on SDA to operate in Hs-mode, allowing transfers at up to 3 MHz. After the Hs-mode master code has been issued, the master transmits a two-wire slave address to initiate a data-transfer operation. The bus continues to operate in Hs-mode until a stop condition occurs on the bus. Upon receiving the stop condition, the TMP75B switches the input and output filters back to fast-mode operation.

7.3.3.8 Timeout Function

The TMP75B resets the serial interface if SCL or SDA are held low for 54 ms (typ) between a start and stop condition. If the TMP75B is pulled low, it releases the bus and then waits for a start condition. To avoid activating the timeout function, it is necessary to maintain a communication speed of at least 1 kHz for the SCL operating frequency.

7.3.3.9 Two-Wire Timing

The TMP75B is two-wire and SMBus compatible. [Figure 8](#) to [Figure 11](#) describe the various operations on the TMP75B. Parameters for [Figure 8](#) are defined in [Table 3](#). Bus definitions are:

Bus Idle Both SDA and SCL lines remain high.

Start Data Transfer A change in the state of the SDA line, from high to low, while the SCL line is high defines a start condition. Each data transfer is initiated with a start condition.

Stop Data Transfer A change in the state of the SDA line from low to high while the SCL line is high defines a stop condition. Each data transfer is terminated with a repeated start or stop condition.

Data Transfer The number of data bytes transferred between a start and a stop condition is not limited, and is determined by the master device.

The receiver acknowledges the transfer of data. It is also possible to use the TMP75B for single-byte updates. To update only the MS byte, terminate communication by issuing a start or stop condition on the bus.

Acknowledge Each receiving device, when addressed, must generate an acknowledge bit.

A device that acknowledges must pull down the SDA line during the acknowledge clock pulse so that the SDA line is stable low during the high period of the acknowledge clock pulse. Setup and hold times must be taken into account. When a master receives data, the termination of the data transfer can be signaled by the master generating a *not-acknowledge* (1) on the last byte transmitted by the slave.

Table 3. Timing Diagram Requirements

SYMBOL	PARAMETER		FAST MODE		HIGH-SPEED MODE		UNIT
			MIN	MAX	MIN	MAX	
$f_{(SCL)}$	SCL operating frequency	$V_S \geq 1.8\text{ V}$	0.001	0.4	0.001	3	MHz
		$V_S < 1.8\text{ V}$	0.001	0.4	0.001	2.5	MHz

7.4 Device Functional Modes

7.4.1 Continuous-Conversion Mode

The default mode of the TMP75B is continuous conversion, where the ADC performs continuous temperature conversions and stores each result to the temperature register, overwriting the result from the previous conversion. Conversion rate bits CR1 and CR0 in the configuration register configure the TMP75B for typical conversion rates of 37 Hz, 18 Hz, 9 Hz, or 4 Hz. The TMP75B has a typical conversion time of 27 ms. To achieve different conversion rates, the TMP75B makes a conversion, and then powers down and waits for the appropriate delay set by CR1 and CR0. The default rate is 37 Hz (no delay between conversions). Table 4 shows the settings for CR1 and CR0.

Table 4. Conversion Rate Settings

CR1	CR0	CONVERSION RATE (TYP)	I _q (TYP)
0	0	37 Hz (continuous conversion, default)	45 μA
0	1	18 Hz	22 μA
1	0	9 Hz	12 μA
1	1	4 Hz	6.5 μA

After power-up or a general-call reset, the TMP75B immediately starts a conversion, as shown in Figure 12. The first result is available after 27 ms (typical). The active quiescent current during conversion is 45 μA (typical at +25°C). The quiescent current during delay is 1 μA (typical at +25°C).

(1) Delay is set by the CR bits in the configuration register.

Figure 12. Conversion Start

7.4.2 Shutdown Mode

Shutdown mode saves maximum power by shutting down all device circuitry other than the serial interface, and reduces current consumption to typically less than 0.3 μA. Shutdown mode is enabled when the SD bit in the configuration register is set to 1; the device shuts down after the current conversion is completed. When SD is equal to 0, the device operates in continuous-conversion mode. When shutdown mode is enabled, the ALERT pin and fault counter clear in both comparator and interrupt modes; however, this clearing occurs with the rising edge of the shutdown signal. After shutdown is enabled, reprogramming shutdown does not clear the ALERT pin and the fault counter until a rising edge is generated on the shutdown signal.

7.4.3 One-Shot Mode

The TMP75B features a *one-shot* temperature measurement mode. When the device is in shutdown mode, writing a 1 to the OS bit starts a single temperature conversion. The device returns to the shutdown state at the completion of the single conversion. This mode reduces power consumption in the TMP75B when continuous temperature monitoring is not required. When the configuration register is read, the OS bit always reads zero.

7.5 Programming

Figure 13 shows the internal register structure of the TMP75B. Use the 8-bit pointer register to address a given data register. The pointer register uses the two LSBs to identify which of the data registers respond to a read or write command. Figure 14 identifies the bits of the pointer register byte.

Figure 13. Internal Register Structure

7.6 Register Map

Table 5 describes the registers available in the TMP75B with their pointer addresses, followed by the description of the bits in each register.

Table 5. Register Map and Pointer Addresses

P1	P0	REGISTER

8 Application and Implementation

8.1 Application Information

The TMP75B is used to measure the PCB temperature of the location it is mounted. The programmable address options allow up to eight locations on the board to be monitored on a single serial bus. Connecting the ALERT pins together and programming the temperature limit registers to desired values allows for a temperature watchdog operation of all devices, interrupting the host controller only if the temperature exceeds the limits.

8.2 Typical Application

Figure 19. Temperature Monitoring of Multiple Locations on a PCB

Typical Application (continued)

8.2.1 Design Requirements

The TMP75B only requires pull-up resistors on SDA and ALERT, although a pull-up resistor is typically present on the SCL as well. A 0.01- μ F bypass capacitor on the supply is recommended, as shown in [Figure 19](#). The SCL, SDA, and ALERT lines can be pulled up to a supply that is equal to or higher than V_S through the pull-up resistors. To configure one of eight different addresses on the bus, connect A0, A1, and A2 to either V_S or GND.

8.2.2 Detailed Design Procedure

The TMP75B should be placed in close proximity to the heat source to be monitored, with a proper layout for good thermal coupling. This ensures that temperature changes are captured within the shortest possible time interval.

8.2.3 Application Curves

[Figure 20](#) shows the step response of the TMP75B to a submersion in an oil bath of 100°C from room temperature (27°C). The time-constant, or the time for the output to reach 63% of the input step, is 1.5 seconds.

Figure 20. Temperature Step Response

9 Power Supply Recommendations

The TMP75B operates with power supply in the range of 1.4 V to 3.6 V. It is optimized for operation at 1.8-V supply but can measure temperature accurately in the full supply range.

A power-supply bypass capacitor is required for stability; place this capacitor as close as possible to the supply and ground pins of the device. A typical value for this supply bypass capacitor is 0.01 μ F. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise.

10 Layout

10.1 Layout Guidelines

Place the power-supply bypass capacitor as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.01 μF . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

Pull up the open-drain output pins (SDA and ALERT) to a supply voltage rail (V_S or higher but up to 3.6 V) through 10-k Ω pull-up resistors.

TMP75BIDR	ACTIVE	SOIC	D	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAU-DCC	Level-1-260C-UNLIM	-55 to 125	TMP75B	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
