

- Performance Up to 8.77 MIPS
- All TMS320C1x Devices are Object Code Compatible
- 144/256-Word On-Chip Data RAM
- 1.5K/4K/8K-Word On-Chip Program ROM
- 4K-Word On-Chip Program EPROM (TMS320E14/P14/E15/P15/E17/P17)
- One-Time Programmable (OTP) Versions Available (TMS320P14/P15/P17)
- EPROM Code Protection for Copyright Security
- 4K / 64K-Word Total External Memory at Full Speed
- 32-Bit ALU/Accumulator
- 16 × 16-Bit Multiplier With a 32-Bit Product
- 0 to 16-Bit Barrel Shifter
- Eight Input/Output Channels
- Dual-Channel Serial Port
- Simple Memory and I/O Interface
- 5-V and 3.3-V Versions Available (TMS320LC15/LC17)
- Commercial and Military Versions Available
- Operating Free-Air Temperature . . . 0°C to 70°C
- Packaging: DIP, PLCC, Quad Flatpack, and CER-QUAD
- CMOS Technology:

## introduction

The TMS32010 digital signal processor (DSP), introduced in 1983, was the first DSP in the TMS320 family. From it has evolved this TMS320C1x generation of 16-bit DSPs. All 'C1x DSPs are object code compatible with the TMS32010 DSP. The 'C1x DSPs combine the flexibility of a high-speed controller with the numerical capability of an array processor, thereby offering an inexpensive alternative to multichip bit-slice processors. The highly paralleled architecture and efficient instruction set provide speed and flexibility to produce a CMOS microprocessor generation capable of executing up to 8.77 MIPS (million instructions per second) ('C16). These 'C1x devices utilize a modified Harvard architecture to optimize speed and flexibility, implementing functions in hardware that other processors implement through microcode or software.

The 'C1x generation's powerful instruction set, inherent flexibility, high-speed number-handling capabilities, reduced power consumption, and innovative architecture have made these cost-effective DSPs the ideal solution for many telecommunications, computer, commercial, industrial, and military applications.

This data sheet provides detailed design documentation for the 'C1x DSPs. It facilitates the selection of devices best suited for various user applications by providing specifications and special features for each 'C1x DSP.

This data sheet is arranged as follows: introduction, quick reference table of device parameters and packages, summary overview of each device, architecture overview, and the 'C1x device instruction set summary. These are followed by data sheets for each 'C1x device providing available package styles, terminal function tables, block diagrams, and electrical and timing parameters. An index is provided to facilitate data sheet usage.

# TMS320C1x DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

Table 1 provides an overview of 'C1x processors with comparisons of memory, I/O, cycle timing, military support, and package types. For specific availability, contact the nearest TI Field Sales Office.

† One-time programmable (OTP) device is in a windowless plastic package and cannot be erased.

NOTES: 1. DIP = dual in-line package. PLCC = plastic-leaded chip carrier. CER = ceramic-leaded chip carrier. QFP = plastic quad flat pack.

2. Military version available.

3. Military versions planned; contact nearest TI Field Sales Office for availability.

4. On-chip 16-bit I/O, four capture inputs, and six compare outputs are available.

5. On-chip 16-bit coprocessor interface is optional by pin selection.

## **description**

### **TMS320C10**

The 'C10 provides the core CPU used in all other 'C1x devices. Its microprocessor operates at 5 MIPS. It provides a parallel I/O of  $8 \times 16$  bits. Three versions with cycle times of 160, 200, and 280 ns are available as illustrated in Table 1. The 'C10 versions are offered in plastic 40-pin DIP or a 44-lead PLCC packages.

### **TMS320C14/E14/P14**

The 'C14/E14/P14 devices, using the 'C10 core CPU, offer expanded on-chip RAM, and ROM or EPROM ('E14/P14), 16 pins of bit selectable parallel I/O, an I/O mapped asynchronous serial port, four 16-bit timers, and external/internal interrupts. The 'C14 devices can provide for microcomputer/microprocessor operating modes. Three versions with cycle times of 160-ns are available as illustrated in Table 1. These devices are offered in 68-pin plastic PLCC or ceramic CER-QUAD packages.

### **TMS320C15/E15/P15**

The 'C15/E15/P15 devices are a version of the 'C10, offering expanded on-chip RAM, and ROM or EPROM ('E15/P15). The 'P15 is a one-time programmable (OTP), windowless EPROM version. These devices can operate in the microcomputer or microprocessor modes. Five versions are available with cycle times of 160 to 200 ns (see Table 1). These devices are offered in 40-pin DIP, 44-pin PLCC, or 44-pin ceramic packages.

### **TMS320LC15**

The 'LC15 is a low-power version of the 'C15, utilizing a  $V_{DD}$  of only 3.3-V. This feature results in a 2.3: 1 power requirement reduction over the typical 5-V 'C1x device. It operates at a cycle time of 250 ns. The device is offered in 40-pin DIP or 44-lead PLCC packages.

### **TMS320C16**

The 'C16 offers on-chip RAM of 256-words, an expanded program memory of 64K-words, and a fast instruction cycle time of 114 ns (8.77 MIPS). It is offered in a 64-pin quad flat-pack package.

### **TMS320C17/E17/P17**

The 'C17/E17/P17 versions consist of five major functional units: the 'C15 microcomputer, a system control register, a full-duplex dual channel serial port,  $\mu$ -law/A-law companding hardware, and a coprocessor port. The dual-channel serial port is capable of full-duplex serial communication and offers direct interface to two combo-codecs. The hardware companding logic can operate in either  $\mu$ -law or A-law format with either sign-magnitude or twos complement numbers in either serial or parallel modes. The coprocessor port allows the 'C17/E17/P17 to act as a slave microcomputer or as a master to a peripheral microcomputer.

The 'P17 utilizes a one-time programmable (OTP) windowless EPROM version of the 'E17.

### **TMS320LC17**

The 'LC17 is a low-power version of the 'C17, utilizing a  $V_{DD}$  of only 3.3-V. This feature results in a 2.3: 1 power requirement reduction over the typical 5-V 'C1x device. It operates at a cycle time of 278 ns.

## architecture

The 'C1x DSPs use a modified Harvard architecture for speed and flexibility. In a strict Harvard architecture, program and data memory lie in two separate spaces, permitting a full overlap of instruction fetch and one-cycle execution. The 'C1x DSPs modification allows transfers between program and data spaces, thereby increasing the flexibility of the device. This modification permits coefficients stored in program memory to be read into the RAM, eliminating the need for a separate coefficient ROM.

### 32-bit accumulator

All 'C1x devices contain a 32-bit ALU and accumulator for support of double-precision, twos-complement arithmetic. The ALU is a general-purpose arithmetic unit that operates on 16-bit words taken from the data RAM or derived from immediate instructions. In addition to the usual arithmetic instructions, the ALU can perform Boolean operations, providing the bit manipulation ability required of a high-speed controller. The accumulator stores the output from the ALU and is often an input to the ALU. It operates with a 32-bit word length. The accumulator is divided into a high-order word (bits 31 through 16) and a low-order word (bits 15 through 0). Instructions are provided for storing the high- and low-order accumulator words in memory.

### shifters

Two shifters are available for manipulating data. The ALU barrel shifter performs a left-shift of 0 to 16 places on data memory words loaded into the ALU. This shifter extends the high-order bit of the data word and zero-fills the low-order bits for twos-complement arithmetic. The accumulator parallel shifter performs a left-shift of 0, 1 or 4 places on the entire accumulator and places the resulting high-order accumulator bits into data RAM. Both shifters are useful for scaling and bit extraction.

### 16 × 16-bit parallel multiplier

The multiplier performs a 16 × 16-bit twos-complement multiplication with a 32-bit result in a single instruction cycle. The multiplier consists of three units: the T Register, P Register, and a multiplier array. The 16-bit T Register stores the multiplicand, and the P Register stores the 32-bit product. Multiplier values either come from the data memory or are derived immediately from the MPYK (multiply immediate) instruction word. The fast on-chip multiplier allows the device to perform fundamental operations such as convolution, correlation, and filtering.

### data and program memory

Since the 'C1x devices use a Harvard type architecture, data and program memory reside in two separate spaces. These DSP devices have 144-or 256-words of on-chip data RAM and 1.5K- to 8K-words of on-chip program ROM. On-chip program EPROM of 4K-words is provided in the 'E14/E15/E17 devices. An on-chip one-time programmable 4K-word EPROM is provided in the 'P14/P15/P17 devices. The EPROM cell utilizes standard PROM programmers and is programmed identically to a 64K CMOS EPROM (TMS27C64). (Reference Table 1.)

### program memory expansion

All 'C1x devices except the 'C17/E17/LC17/P17 devices are capable of executing from off-chip external memory at full speed for those applications requiring external program memory space. This allows for external RAM-based systems to provide multiple functionality. The 'C17/E17/LC17/P17 devices provide no external memory expansion. (Reference Table 1.)

### microcomputer/microprocessor operating modes

All devices except the 'x17 offer two modes of operation defined by the state of the  $\overline{MC/MP}$  pin: the microcomputer mode ( $\overline{MC/MP} = 1$ ) or the microprocessor mode ( $\overline{MC/MP} = 0$ ). In the microcomputer mode, on-chip ROM is mapped into the program memory space. In the microprocessor mode, all words of program memory are external.

# TMS320C1x

## DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

---

### interrupts and subroutines

All devices except the 'C16 contain a four-level stack for saving the contents of the program counter during interrupts and subroutine calls. Because of the larger 64K program space, the 'C16's hardware stack has been increased to eight levels. Instructions are available for saving the device's complete context. PUSH and POP instructions permit a level of nesting restricted only by the amount of available RAM. The interrupts used in these devices are maskable.

### input/output

The 16-bit parallel data bus can be utilized to perform I/O functions in two cycles. The I/O ports are addressed by the three LSBs on the address lines. In addition, a polling input for bit test and jump operations (BIO) and an interrupt pin (INT) have been incorporated for multitasking. The bit selectable I/O of the 'C14 is suitable for microcontroller applications.

### serial port (TMS320C17/E17)

Two of the I/O ports on the 'C17/E17 are dedicated to the serial port and companding hardware. I/O port 0 is dedicated to control register 0, which controls the serial port, interrupts, and companding hardware. I/O port 1 accesses control register 1, as well as both serial port channels, and companding hardware. The six remaining I/O ports are available for external parallel interfaces.

### serial port (TMS320C14/E14)

The 'C14/E14 devices include one I/O-mapped serial port that operates asynchronously. I/O-mapped control registers are used to configure port parameters such as inter-processor communication protocols and baud rate.

### companding hardware (TMS320C17/E17)

On-chip hardware enables the 'C17/E17 to compand (COMpress/exPAND) data in either  $\mu$ -law or A-law format. The companding logic operation is configured via the system control register. Data may be companded in either serial mode for operation on serial port data (converting between linear and logarithmic PCM) or a parallel mode for computation inside the device. The 'C17/E17 allows the hardware companding logic to operate with either sign-magnitude or twos-complement numbers.

### coprocessor port (TMS320C17/E17)

The coprocessor port on the 'C17/E17 provides a direct connection to most microcomputers and microprocessors. The port is accessed through I/O port 5 using IN and OUT instructions. The coprocessor interface allows the device to act as a peripheral (slave) microcomputer to a microprocessor, or as a master to a peripheral microcomputer. In the microcomputer mode, the 16 data lines are used for the 6 parallel 16-bit I/O ports. In the coprocessor mode, the 16-bit parallel port is reconfigured to operate as a 16-bit latched bus interface. For peripheral transfer, an 8-bit or 16-bit length of the coprocessor port can be selected.

**instruction set**

A comprehensive instruction set supports both numeric-intensive operations, such as signal processing, and general-purpose operations, such as high-speed control. All of the 'C1x devices are object-code compatible and use the same 60 instructions. The instruction set consists primarily of single-cycle single-word instructions, permitting execution rates of more than six million instructions per second. Only infrequently used branch and I/O instructions are multicycle. Instructions that shift data as part of an arithmetic operation execute in a single cycle and are useful for scaling data in parallel with other operations.

**NOTE**

The  $\overline{\text{BIO}}$  pin on other 'C1x devices is not available for use in the 'C14/E14/P14. An attempt to execute the BIOZ (Branch on  $\overline{\text{BIO}}$  low) instruction will result in a two cycle NOP action.

Three main addressing modes are available with the instruction set: direct, indirect, and immediate addressing.

**direct addressing**

In direct addressing, seven bits of the instruction word concatenated with the 1-bit data page pointer form the data memory address. This implements a paging scheme in which the first page contains 128 words, and the second page contains up to 128 words.

**indirect addressing**

Indirect addressing forms the data memory address from the least-significant eight bits of one of the two auxiliary registers, AR0-AR1. The Auxiliary Register Pointer (ARP) selects the current auxiliary register. The auxiliary registers can be automatically incremented or decremented and the ARP changed in parallel with the execution of any indirect instruction to permit single-cycle manipulation of data tables. Indirect addressing can be used with all instructions requiring data operands, except for the immediate operand instructions.

**immediate addressing**

Immediate instructions derive data from part of the instruction word rather than from the data RAM. Some useful immediate instructions are multiply immediate (MPYK), load accumulator immediate (LACK), and load auxiliary register immediate (LARK).

**instruction set summary**

Table 2 lists the symbols and abbreviations used in Table 3, the instruction set summary. Table 3 contains a short description and the opcode for each 'C1x instruction. The summary is arranged according to function and alphabetized within each functional group.

**Table 2. Instruction Symbols**

SYMBOL	MEANING
ACC	Accumulator
D	Data memory address field
M	Addressing mode bit
K	Immediate operand field
PA	3-bit port address field
R	1-bit operand field specifying auxiliary register
S	4-bit left-shift code
X	3-bit accumulator left-shift field

## Key Features: TMS320C10

- **Instruction Cycle Timing**
  - 160-ns (TMS320C10-25)
  - 200-ns (TMS32010)
  - 280-ns (TMS320C10-14)
- **144 Words of On-Chip Data RAM**
- **1.5K Words On-Chip Program ROM**
- **External Memory Expansion up to 4K Words at Full Speed**
- **16 × 16-Bit Multiplier With 32-Bit Product**
- **0 to 16-Bit Barrel Shifter**
- **On-Chip Clock Oscillator**
- **Device Packaging:**
  - 40-Pin DIP
  - 44-Lead PLCC
- **Single 5-V Supply**
- **Operating Free-Air Temperature Range**  
... 0°C to 70°C

# TMS320C10, TMS320C10-14, TMS320C10-25 DIGITAL SIGNAL PROCESSORS

## TERMINAL FUNCTIONS

NAME	I/O†	DEFINITION
A11-A0/PA2-PA0	O	External address bus. I/O port address multiplexed over PA2-PA0.
$\overline{\text{BIO}}$	I	External polling input
CLKOUT	O	System clock output, 1/4 crystal/CLKIN frequency
D15-D0	I/O	16-bit parallel data bus
$\overline{\text{DEN}}$	O	Data enable for device input data on D15-D0
$\overline{\text{INT}}$	I	External interrupt input
$\overline{\text{MC/MP}}$	I	Memory mode select pin. High selects microcomputer mode. Low selects microprocessor mode.
$\overline{\text{MEN}}$	O	Memory enable indicates that D15-D0 will accept external memory instruction.
NC	O	No connection
$\overline{\text{RS}}$	I	Reset for initializing the device
VCC	I	+ 5 V supply
VSS	I	Ground
$\overline{\text{WE}}$	O	Write enable for device output data on D15-D0
X1	O	Crystal output for internal oscillator
X2/CLKIN	I	Crystal input internal oscillator or external system clock input

† Input/Output/High-impedance state.

## electrical characteristics over specified temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS (SEE FIGURE 2)	MIN	TYP†	MAX	UNIT
$I_{CC}^{\ddagger}$ Supply current	TMS320C10	$f = 20.5 \text{ MHz}$ , $V_{CC} = 5.5 \text{ V}$ , $T_A = -40^\circ\text{C}$ to $85^\circ\text{C}$		33	55	mA
	TMS320C10-25	$f = 25.6 \text{ MHz}$ , $V_{CC} = 5.5 \text{ V}$ , $T_A = -0^\circ\text{C}$ to $70^\circ\text{C}$		40	65	

† All typical values are at  $T_A = 70^\circ\text{C}$  and are used for thermal resistance calculations.

‡  $I_{CC}$  characteristics are inversely proportional to temperature. For  $I_{CC}$  dependence on temperature, frequency, and loading.

## CLOCK CHARACTERISTICS AND TIMING

The 'C10/C10-25 can use either its internal oscillator or an external frequency source for a clock.

### internal clock option

The internal oscillator is enabled by connecting a crystal across X1 and X2/CLKIN (see Figure 1). The frequency of CLKOUT is one-fourth the crystal fundamental frequency. The crystal should be fundamental mode, and parallel resonant, with an effective series resistance of 30 ohms, a power dissipation of 1 mW, and should be specified at a load capacitance of 20 pF.

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
Crystal frequency, $f_x$	TMS320C10	$T_A = -40^\circ\text{C}$ to $85^\circ\text{C}$	6.7		20.5	MHz
	TMS320C10-25	$T_A = 0^\circ\text{C}$ to $70^\circ\text{C}$	6.7		25.6	
C1, C2		$T_A = -40^\circ\text{C}$ to $85^\circ\text{C}$		10		pF

### external clock option

An external frequency source can be used by injecting the frequency directly into X2/CLKIN with X1 left unconnected. The external frequency injected must conform to the specifications listed in the table below.

## switching characteristics over recommended operating conditions

PARAMETER	TEST CONDITIONS	TMS320C10			TMS320C10-25			UNIT

## SUGGESTED I/O DECODE CIRCUIT

The circuit shown in Figure 3 is a design example for interfacing I/O devices to the 'C10/C10-25. This circuit decodes the address for output operations using the OUT instruction. The same circuit can be used to decode input and output operations if the inverter ('ALS04) is replaced with a NAND gate and both  $\overline{DEN}$  and  $\overline{WE}$  are connected. Inputs and outputs can be decoded at the same port provided the output of the decoder ('AS137) is gated with the appropriate signal ( $\overline{DEN}$  or  $\overline{WE}$ ) to select read or write (using an 'ALS32). Access times can be increased when the circuit shown in Figure 3 is repeated to support IN instructions with  $\overline{DEN}$  connected rather than  $\overline{WE}$ .

The table write (TBLW) function requires a different circuit. A detailed discussion of an example circuit for this function is described in the application report, "Interfacing External Memory to the TMS32010", published in the book, *Digital Signal Processing Applications with the TMS320 Family* (SPRA012A).

## DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

### electrical characteristics over specified temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP†	MAX	UNIT
$I_{CC}^{\ddagger}$ Supply current	$f = 14.4$ , MHz, $V_{CC} = 5.5$ V, $T_A = 0^{\circ}\text{C}$ to $70^{\circ}\text{C}$		28	65	mA

† All typical values are at  $T_A = 70^{\circ}\text{C}$  and are used for thermal resistance calculations.

‡  $I_{CC}$  characteristics are inversely proportional to temperature; i.e.,  $I_{CC}$  decreases approximately linearly with temperature.

### CLOCK CHARACTERISTICS AND TIMING

The TMS320C10-14 can use either its internal oscillator or an external frequency source for a clock.

#### internal clock option

The internal oscillator is enabled by connecting a crystal across X1 and X2/CLKIN (see Figure 1). The frequency of CLKOUT is one-fourth the crystal fundamental frequency. The crystal should be fundamental mode, and parallel resonant, with an effective series resistance of 30 ohms, a power dissipation of 1 mW, and be specified at a load capacitance of 20 pF.

PARAMETER	TEST CONDITIONS	MIN	NOM	MAX	UNIT
Crystal frequency, $f_x$	$T_A = 0^{\circ}\text{C}$ to $70^{\circ}\text{C}$	6.7		14.4	MHz
C1, C2	$T_A = 0^{\circ}\text{C}$ to $70^{\circ}\text{C}$		10		pF

#### external clock option

An external frequency source can be used by injecting the frequency directly into X2/CLKIN with X1 left unconnected. The external frequency injected must conform to the specifications listed in the table below.

#### switching characteristics over recommended operating conditions

	TEST CONDITIONS	MIN	NOM	MAX	UNIT	
$t_{c(C)}$ CLKOUT cycle time <sup>§</sup>	$R_L = 825 \Omega$ , $C_L = 100$ pF, (see Figure 2)	277.78			ns	
$t_r(C)$ CLKOUT rise time			10		ns	
$t_f(C)$ CLKOUT fall time			8		ns	
$t_w(CL)$ Pulse duration, CLKOUT low				131		ns
$t_w(CH)$ Pulse duration, CLKOUT high				129		ns
$t_d(MCC)$ Delay time, CLKIN $\uparrow$ to CLKOUT $\downarrow$			25 <sup>¶</sup>		60 <sup>¶</sup>	ns

§  $t_{c(C)}$  is the cycle time of CLKOUT, i.e.,  $4t_{c(MC)}$  (4 times CLKIN cycle time if an external oscillator is used).

¶ Values derived from characterization data and not tested.

## reset timing

- NOTES: A.  $\overline{RS}$  forces  $\overline{DEN}$ ,  $\overline{WE}$ , and  $\overline{MEN}$  high and places data bus D0 through D15 in a high-impedance state. AB outputs (and program counter) are synchronously cleared to zero after the next complete CLK cycle from  $\overline{RS}\downarrow$ .
- B.  $\overline{RS}$  must be maintained for a minimum of five clock cycles.
- C. Resumption of normal program will commence after one complete CLK cycle from  $\overline{RS}\uparrow$ .
- D. Due to the synchronization action on  $\overline{RS}$ , time to execute the function can vary dependent upon when  $\overline{RS}\uparrow$  or  $\overline{RS}\downarrow$  occur in the CLK cycle.
- E. Diagram shown is for definition purpose only.  $\overline{DEN}$ ,  $\overline{WE}$ , and  $\overline{MEN}$  are mutually exclusive.
- F. During a write cycle,  $\overline{RS}$  may produce an invalid write address.

## Key Features: TMS320C14/E14/P14

- 160-ns Instruction Cycle
- 256 Words of On-Chip Data RAM
- 4K Words of On-Chip Program ROM (TMS320C14)
- 4K Words of On-Chip Program EPROM (TMS320E14/P14)
- One-Time Programmable (OTP) Windowless EPROM Version Available ('320P14)
- EPROM Code Protection for Copyright Security
- External Memory Expansion up to 4K-Words at Full Speed (Microprocessor Mode)
- 16 × 16-Bit Multiplier With 32-Bit Product
- 0 to 16-Bit Barrel Shifter
- Seven Input and Seven Output External Ports
- Bit Selectable I/O Port (16 Pins)
- 16-Bit Bidirectional Data Bus With Greater than 50-Mbps Transfer Rate
- Asynchronous Serial Port
- 15 Internal/External Interrupts
- Event Manager With Capture Inputs and Compare Outputs
- Four Independent Timers [Watchdog, General Purpose (2), Serial Port]
- Four-Level Hardware Stack
- Packaging: 68-Pin PLCC (FN Suffix) or CLCC (FZ Suffix)
- Single 5-V Supply
- Operating Free-Air Temperature . . . 0°C to 70°C

## introduction

The 'C14/E14/P14 are 16/32-bit single-chip digital signal processing (DSP) microcontrollers that combine the high performance of a DSP with on-chip peripherals. With a 160-ns instruction cycle, these devices are capable of executing up to 6.4 million instructions per second (MIPS). The 'C14/E14/P14 DSPs are ideal for applications such as automotive control systems, computer peripherals, industrial controls, and military command/control system applications.

Control-specific on-chip peripherals include: An event manager with 6 channel PWM D/A, 6-bit I/O pins, an asynchronous serial port, four 16-bit timers, and internal/external interrupts.

With 4K-words of on-chip ROM, the 'C14 is a mask programmable device. Code is provided by the customer, and TI incorporates the customer's code into the photomask. It is offered in a 68-pin plastic chip carrier package (FN suffix), rated for operation from 0°C to 70°C.

The 'E14 is provided with a 4K-word on-chip EPROM. This EPROM version is excellent for prototyping and for customized applications. It is programmable with standard EPROM programmers. It is offered in a 68-pin (windowed) cerquad package (FZ suffix), rated for operation from 0°C to 70°C.

The 'P14 features a one-time programmable 4K-word on-chip EPROM. The 'P14 is provided in an unprogrammed state and is programmed as if it were a blank 'E14. It is offered in a low-cost, volume-production-oriented, 68-pin plastic leaded chip carrier (PLCC) package (FN suffix), rated for operation from 0°C to 70°C.

# TMS320C14, TMS320E14, TMS320P14 DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

Each device can execute programs from either internal ( $\overline{MC/\overline{MP}}=0$ ) or external program memory ( $\overline{MC/\overline{MP}}=1$ ). For proprietary code security, the 'E14 and 'P14 incorporate an EPROM protect bit (RBIT). If this bit is programmed, the device's internal program memory cannot be accessed by any external means.

## TERMINAL FUNCTIONS

PIN		I/O/Z†	DESCRIPTION
NAME	NO.		ADDRESS/DATA BUSES
A11	5	O/Z	Program memory address bus A11 (MSB) through A0 (LSB) and port addresses PA2 (MSB) through PA0 (LSB). Addresses A11 through A0 are always active and never go to high impedance except during reset. During execution of the IN and OUT instructions, pins 26, 27, and 28 carry the port addresses. Pins A3 through A11 are held high when port accesses are made on pins PA0 through PA2.
A10	6		
A9	9		
A8	12		
A7	13		
A6	14		
A5	20		
A4	21		
A3	25		
A2/PA2	26		
A1/PA1	27		
A0/PA0	28		
D15 MSB	35	I/O/Z	Parallel data bus D15 (MSB) through D0 (LSB). The data bus is always in the high-impedance state except when $\overline{WE}$ is active (low). The data bus is also active when internal peripherals are written to.
D14	36		
D13	39		
D12	40		
D11	43

D2	62		
D1	63		
D0 LSB	64		
<b>INTERRUPT AND MISCELLANEOUS SIGNALS</b>			
$\overline{INT}$	18	I	External interrupt input. The interrupt signal is generated by a high-to-low transition on this pin.
$\overline{NMI/\overline{MC/\overline{MP}}}$	22	I	Non-maskable interrupt. When this pin is brought low, the device is interrupted irrespective of the state of the INTM bit in status register ST.  Microcomputer/microprocessor select. This pin is also sampled when $\overline{RS}$ is low. If high during reset, internal program memory is selected. If low during reset, external memory will be selected.
$\overline{WE}$	15	O	Write enable. When active low, $\overline{WE}$ indicates that device will output data on the bus.
$\overline{REN}$	16	O	Read enable. When active low, $\overline{REN}$ indicates that device will accept data from the bus.
$\overline{RS}$	17	I	Reset. When this pin is low, the device is reset and PC is set to zero.

Continued next page.

† Input/Output/High-impedance state.

**TERMINAL FUNCTIONS (concluded)**

PIN		I/O/Z†	DESCRIPTION
NAME	NO.		SUPPLY/OSCILLATOR SIGNALS
CLKOUT	19	O	System clock output (one fourth CLKIN frequency).
VCC	4,33	I	5-V supply pins.
VSS	3,34	I	Ground pins.
CLKIN	24	I	Master clock input from external clock source.
<b>SERIAL PORT AND TIMER SIGNALS</b>			
RXD	48	I	Asynchronous mode receive input.
TXD	47	O/Z	Asynchronous mode transmit output.
TCLK1	10	I	Timer 1 clock. If external clock is selected, it serves as clock input to Timer 1.
TCLK2	11	I	Timer 2 clock. If external clock is selected, it serves as clock input to Timer 2.
WDT	23	O	Watchdog timer output. An active low is generated on this pin when the watchdog timer times out.
<b>BIT I/O PINS</b>			
IOP15 MSB	29	I/O	16 bit I/O lines that can be individually configured as inputs or outputs and also individually set or reset when configured as outputs.
IOP14	30		
IOP13	31		
IOP12	32		
IOP11	37

SPRS009C—JANUARY 1987—REVISED JULY 1991

## functional block diagram

## architecture

The 'C1x family utilizes a modified Harvard architecture for speed and flexibility. In a strict Harvard architecture, program and data memory lie in two separate spaces, permitting a full overlap of instruction fetch and execution. The 'C1x family's modification of a Harvard architecture allows transfers between program and data spaces, thereby increasing the flexibility of the device. This modification permits coefficients stored in program memory to be read into the RAM, eliminating the need for a separate coefficient ROM. It also makes available immediate instructions and subroutines based on computed values.

### 32-bit ALU/accumulator

The 'C14/E14/P14 devices contain a 32-bit ALU and accumulator for support of double-precision, twos-complement arithmetic. The ALU is a general-purpose arithmetic unit that operates on 16-bit words taken from the data RAM or derived from immediate instructions. In addition to the usual arithmetic instructions, the ALU can perform Boolean operations, providing the bit manipulation ability required of a high-speed controller.

The accumulator stores the output from the ALU and is often an input to the ALU. It operates with a 32-bit wordlength. The accumulator is divided into a high-order word (bits 31 through 16) and a low-order word (bits 15 through 0). Instructions are provided for storing the high- and low- order accumulator words in memory.

## shifters

Two shifters are available for manipulating data. The ALU barrel shifter performs a left-shift of 0 to 16 places on data memory words loaded into the ALU. This shifter extends the high-order bit of the data word and zero-fills the low-order bits for twos-complement arithmetic. The accumulator parallel shifter performs a left-shift of 0, 1, or 4 places on the entire accumulator and places the resulting high-order accumulator bits into data RAM. Both shifters are useful for scaling and bit extraction

## 16 × 16-bit parallel multiplier

The multiplier performs a 16 × 16-bit twos-complement multiplication with a 32-bit result in a single instruction cycle. The multiplier consists of three units: the T Register, P Register, and the multiplier array. The 16-bit T Register temporarily stores the multiplicand; the P Register stores the 32-bit product. Multiplier values either come from the data memory or are derived immediately from the MPYK (multiply immediate) instruction word. The fast on-chip multiplier allows the device to perform fundamental operations such as convolution, correlation, and filtering.

## data and program memory

Since the 'C14/E14/P14 devices use a Harvard architecture, data and program memory reside in two separate spaces. These devices have 256 words of on-chip data RAM and 4K words of on-chip program ROM ('C14) or EPROM ('E14 and the OTP 'P14). The EPROM cell utilizes standard PROM programmers and is programmed identically to a 64K-bit CMOS EPROM (TMS27C64).

## program memory expansion

The 'C1x devices are capable of executing up to 4K words of external memory at full speed for those applications requiring external program memory space. This allows for external RAM-based systems to provide multiple functionality.

## microcomputer/microprocessor operating modes

The 'C14/E14/P14 devices offer two modes of operation defined by the state of the  $\overline{\text{NMI}}/\text{MC}/\overline{\text{MP}}$  pin during reset: the microcomputer mode ( $\overline{\text{NMI}}/\text{MC}/\overline{\text{MP}}$  is high) or the microprocessor mode ( $\overline{\text{NMI}}/\text{MC}/\overline{\text{MP}}$  is low). In the microcomputer mode, the on-chip ROM is mapped into the program memory space. In the microprocessor mode, all 4K words of memory are external.

## interrupts and subroutines

The 'C14/E14/P14 devices contain a four-level hardware stack for saving the contents of the program counter during interrupts and subroutine calls. Instructions are available for saving the complete context of the device. PUSH and POP instructions permit a level of nesting restricted only by the amount of available RAM. The 'C14/E14/P14 have a total of 15 internal/external interrupts. Fourteen of these are maskable;  $\overline{\text{NMI}}$  is the fifteenth.

## input/output

The 16-bit parallel data bus can be utilized to access external peripherals. However, only the lower three address lines are active. The upper nine address lines are driven high.

## bit I/O

The 'C14/E14/P14 has 16 pins of bit I/O that can be individually configured as inputs or outputs. Each of the pins can be set or cleared without affecting the others. The input pins can also detect and match patterns and generate a maskable interrupt signal to the CPU.

## serial port

The 'C14/E14/P14 includes an I/O-mapped asynchronous serial port.

# TMS320C14, TMS320E14, TMS320P14 DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

---

## event manager

An event manager is included that provides up to four capture inputs and up to six compare outputs. This peripheral operates with the timers to provide a form of programmable event logging/detection. The six compare outputs can also be configured to produce six channels of high precision PWM.

## timers 1 and 2

Two identical 16-bit timers are provided for general purpose applications. Both timers include a 16-bit period register and buffer latch, and can generate a maskable interrupt.

## serial port timer

The serial port timer is a 16-bit timer primarily intended for baud rate generation for the serial port. Its architecture is the same as timers 1 and 2, therefore it can serve as a general purpose timer if not needed for serial communication.

## watchdog timer

The 'C14/E14/P14 contain a 16-bit watchdog timer that can produce a timeout ( $\overline{\text{WDT}}$ ) signal for various applications such as software development and event monitoring. The watchdog timer also generates, at the point of the timeout, a maskable interrupt signal to the CPU.

## instruction set

A comprehensive instruction set supports both numeric-intensive operations, such as signal processing, and general-purpose operations, such as high-speed control. All of the first-generation devices are object-code compatible and use the same 60 instructions. The instruction set consists primarily of single-cycle single-word instructions, permitting execution rates of more than six million instructions per second. Only infrequently used branch and I/O instructions are multicycle. Instructions that shift data as part of an arithmetic operation execute in a single cycle and are useful for scaling data in parallel with other operations.

### NOTE

The  $\overline{\text{BIO}}$  pin on other 'C1x devices is not available for use in the 'C14/E14/P14 devices. An attempt to execute the BIOZ (Branch on  $\overline{\text{BIO}}$  low) instruction will result in a two cycle NOP action.

Three main addressing modes are available with the instruction set: direct, indirect, and immediate addressing.

### direct addressing

In direct addressing, seven bits of the instruction word concatenated with the 1-bit data page pointer from the data memory address. This implements a paging scheme in which each page contains 128 words.

### indirect addressing

Indirect addressing forms the data memory address from the least-significant eight bits of one of the two auxiliary registers, AR0 and AR1. The Auxiliary Register Pointer (ARP) selects the current auxiliary register. The auxiliary registers can be automatically incremented or decremented and the ARP changed in parallel with the execution of any indirect instruction to permit single-cycle manipulation of data tables. Indirect addressing can be used with all instructions requiring data operands, except for the immediate operand instructions.

### immediate addressing

Immediate instructions derive data from part of the instruction word rather than from part of the data RAM. Some useful immediate instructions are multiply immediate (MPYK), load accumulator immediate (LACK), and load auxiliary register immediate (LARK).

**electrical specifications**

This section contains all the electrical specifications for the 'C14/E14/P14 devices, including test parameter measurement information. Parameters with  $V_{PP}$  subscripts apply only to the 'E14 and 'P14 in the EPROM programming mode.

**absolute maximum ratings over specified temperature range (unless otherwise noted)†**

Supply voltage range, $V_{CC}$ (see Note 6)	.....	-0.3 V to 7 V
Supply voltage range, $V_{PP}$ (see Note 6)	.....	-0.6 V to 14 V
Input voltage range	.....	-0.3 V to 14 V
Output voltage range	.....	-0.3 V to 7 V
Continuous power dissipation	.....	0.5 W
Air temperature range above operating device: L version	.....	0 °C to 70 °C
Storage temperature	.....	-55 °C + 150 °C

† Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 6: All voltage values are with respect to  $V_{SS}$ .

**recommended operating conditions**

		MIN	NOM	MAX	UNIT
$V_{CC}$	Supply voltage				
	Operating voltage	4.75	5	5.25	V
	Fast programming	5.75	6	6.25	V
	SNAP! Pulse programming	6.25	6.5	6.75	V
$V_{PP}$	Supply voltage for Fast programming (see Note 11)	12.25	12.5	12.75	V
$V_{PP}$	Supply voltage for SNAP! Pulse programming (see Note 11)	12.75	13	13.25	V
$V_{SS}$	Supply voltage		0		V
$V_{IH}$	High-level input voltage	CLKIN, CAP0, CAP1, CMP4/CAP2, CMP5/CAP3, $\overline{RS}$	3		V
		All remaining inputs	2		
$V_{IL}$	Low-level input voltage, all inputs			0.8	V
$I_{OH}$	High-level output current, all outputs			-300	$\mu A$
$I_{OL}$	Low-level output current, all outputs			2	mA
$T_A$	Operating free-air temperature	0		70	°C

NOTE 11:  $V_{PP}$  can be applied only to programming pins designed to accept  $V_{PP}$  as an input. During programming the total supply current is  $I_{PP} + I_{CC}$ .

SPRS009C—JANUARY 1987—REVISED JULY 1991

## reset timing

- NOTES: A.  $\overline{RS}$  forces  $\overline{REN}$ , and  $\overline{WE}$  high and then places data bus D0-D15,  $\overline{REN}$ ,  $\overline{WE}$ , and address bus A0-A11 in a high-impedance state.  $\overline{AB}$  outputs (and program counter) are synchronously cleared to zero after the next complete CLK cycle from  $\overline{RS}\uparrow$ .
- B.  $\overline{RS}$  must be maintained for a minimum of five clock cycles.
- C. Resumption of normal program will commence after one complete CLK cycle from  $\overline{RS}\uparrow$ .
- D. Due to the synchronization action on  $\overline{RS}$ , time to execute the function can vary dependent upon when  $\overline{RS}\uparrow$  or  $\overline{RS}\downarrow$  occur in the CLK cycle.
- E. Diagram shown is for definition purpose only.  $\overline{WE}$  and  $\overline{REN}$  are mutually exclusive.

## PROGRAMMING THE TMS320E14/P14 EPROM CELL

The 'E14 and 'P14 include a  $4K \times 16$ -bit industry-standard EPROM cell for prototyping and low-volume production. The 'C14 with a 4K-word masked ROM then provides a migration path for cost-effective production. An EPROM adapter socket (part # TMDX3270110), shown in Figure 5, is available to provide 68-pin to 28-pin conversion for programming the 'E14 and 'P14.

Key features of the EPROM cell include the normal programming operation as well as verification. The EPROM cell also includes a code protection feature that allows code to be protected against copyright violations.

The 'E14/P14 EPROM cells are programmed using the same family and device codes as the TMS27C64  $8K \times 8$ -bit EPROM. The TMS27C64 EPROM series are ultraviolet-light erasable, electrically programmable, read-only memories, fabricated using HVC MOS technology. They are pin compatible with existing 28-pin ROMs and EPROMs. These EPROMs operate from a 5-V supply in the read mode; however, a 12.5-V supply is needed for programming. All programming signals are TTL level. For programming outside the system, existing EPROM programmers can be used. Locations may be programmed singly, in blocks, or at random.

Figure 5. EPROM Adapter Socket

The 'E14/P14 devices use 13 address lines to address the 4K-word memory in byte format (8K-byte memory). In word format, the most-significant byte of each word is assigned an even address and the least-significant byte an odd address in the byte format. Programming information should be downloaded to EPROM programmer memory in a high-byte to low-byte order for proper programming of the devices (see Figure 6).

Figure 6. Programming Data Format

Figure 7 shows the wiring conversion to program the 'E14 and 'P14 using the 28-pin pinout of the TMS27C64. The table of pin nomenclature provides a description of the TMS27C64 pins.

**CAUTION**

The 'E14 and 'P14 do not support the signature mode available with some EPROM programmers. The signature mode places high voltage (12.5 V<sub>dc</sub>) on pin A9. The 'E14 and 'P14 EPROM cells are not designed for this feature and will be damaged if subjected to it. A 3.9 kΩ resistor is standard on the TI programmer socket between pin A9 and programmer. This protects the device from unintentional use of the signature mode.

A3-A0	66, 65, 56, 55	7-10	ADDR	ADDR	ADDR	X	X

† Signal names shown for 'E14/P14 EPROM programming mode only.

**Legend:**

- V<sub>IH</sub> = TTL high level; V<sub>IL</sub> = TTL low level; ADDR = byte address bit; V<sub>PP</sub> = 12.5 V ± 0.25 V (FAST) or 13 V ± 0.25 V (SNAP! Pulse).
- V<sub>CC</sub> = 5 V ± 0.25 V; X = don't care; PULSE = low-going TTL pulse.
- D<sub>IN</sub> = byte to be programmed at ADDR; Q<sub>OUT</sub> = byte stored at ADDR.; RBIT = ROM protect bit
- V<sub>CCP</sub> = 6 V ± 0.25 V (FAST) or 6.5 V ± 0.25 V (SNAP! Pulse).

**programming**

Since every memory in the cell is at a logic high, the programming operation reprograms selected bits to low. Once the '320E14 is programmed, these bits can only be erased using ultraviolet light. The correct byte is placed on the data bus with V<sub>PP</sub> set to the 12.5-V level. The  $\overline{PGM}$  pin is then pulsed low to program in the zeros.

# TMS320E14, TMS320P14 DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

## erasure

Before programming, the 'E14 must be erased by exposing it to ultraviolet light. The recommended minimum exposure dose (UV-intensity  $\times$  exposure-time) is 15 W•s/cm<sup>2</sup>. A typical 12-mW•s/cm<sup>2</sup>, filterless UV lamp will erase the device in 21 minutes. The lamp should be located about 2.5 cm above the chip during erasure. After exposure, all bits are in the high state.

## verify/read

To verify correct programming, the EPROM cell can be read using either the verify or read line definitions shown in Table 5, assuming the inhibit bit (RBIT) has not been programmed.

## program inhibit

Programming may be inhibited by maintaining a high level input on the  $\bar{E}$  pin or  $\bar{PGM}$  pin.

## standard programming procedure

Before programming, the 'E14 must first be completely erased. The device can then be programmed with the correct code. It is advisable to program unused sections with zeros as a further security measure. After the programming is complete, the code programmed into the cell should be verified. If the cell passes verification, the next step is to program the ROM protect bit (RBIT). Once the RBIT programming is verified, an opaque label should be placed over the window to protect the EPROM cell from inadvertent erasure by ambient light. At this point, the programming is complete, and the device is ready to be placed into its destination circuit.

Refer to other appendices of the *TMS320C1x User's Guide* for additional information on EPROM programming.

## recommended timing requirements for programming: $V_{CC} = 6\text{ V}$ and $V_{PP} = 12.5\text{ V}$ (FAST) or $V_{CC} = 6.5\text{ V}$ and $V_{PP} = 13\text{ V}$ (SNAP! PULSE), $T_A = 25^\circ\text{C}$ (see Note 13)

		MIN	NOM	MAX	UNIT	
$t_w(\text{PGM})$	Initial program pulse duration	Fast programming algorithm	0.95	1	1.05	ms
		SNAP! Pulse programming algorithm	95	100	105	$\mu\text{s}$
$t_w(\text{FPGM})$	Final pulse duration	Fast programming only		78.75	ms	
$t_{su}(\text{A})$	Address setup time	2			$\mu\text{s}$	
$t_{su}(\text{E})$	$\bar{E}$ setup time	2			$\mu\text{s}$	
$t_{su}(\text{G})$	$\bar{G}$ setup time	2			$\mu\text{s}$	
$t_{su}(\text{D})$	Data setup time	2			$\mu\text{s}$	
$t_{su}(\text{VPP})$	$V_{PP}$ setup time	2			$\mu\text{s}$	
$t_{su}(\text{VCC})$	$V_{CC}$ setup time	2			$\mu\text{s}$	
$t_h(\text{A})$	Address hold time	0			$\mu\text{s}$	
$t_h(\text{D})$	Data hold time	2			$\mu\text{s}$	

NOTE 13: For all switching characteristics and timing measurements, input pulse levels are 0.4 V to 2.4 V and  $V_{PP} = 12.5\text{ V} \pm 0.5\text{ V}$  during programming.

program cycle timing

$^\dagger t_{dis}(G)$  and  $t_{en}(G)$  are characteristics of the device but must be accommodated by the programmer.

‡ I<sub>CC</sub> characteristics are inversely proportional to temperature. For I<sub>CC</sub> dependence on temperature, frequency, and loading, see Figure 3.

NOTE 7: This voltage specification is included for interface to HC logic. However, note that all of the other timing parameters defined in this data sheet are specified for TTL logic levels and will differ for HC logic levels.

## CLOCK CHARACTERISTICS AND TIMING

The TMS320C15/E15/P15 can use either its internal oscillator or an external frequency source for a clock.

### internal clock option

The internal oscillator is enabled by connecting a crystal across X1 and X2/CLKIN (see Figure 1). The frequency of CLKOUT is one-fourth the crystal fundamental frequency. The crystal should be fundamental mode, and parallel resonant, with an effective series resistance of 30 ohms, a power dissipation of 1 mW, and should be specified at a load capacitance of 20 pF.

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
Crystal frequency, f <sub>x</sub>	TMS320C15	T <sub>A</sub> = 0°C to 70°C	6.7		20.5	MHz
	TMS320E15/P15	T <sub>A</sub> = -40°C to 85°C	6.7		20.5	
	TMS320C15-25/E15-25	T <sub>A</sub> = 0°C to 70°C	6.7		25.6	
C1, C2		T <sub>A</sub> = 0°C to 70°C		10		pF

**external clock option**

An external frequency source can be used by injecting the frequency directly into X2/CLKIN with X1 left unconnected. The external frequency injected must conform to the specifications listed in the table below.

**switching characteristics over recommended operating conditions**

PARAMETER	TEST CONDITIONS	TMS320C15/E15/P15			TMS320C15-25/E15-25			UNIT

reset timing

- NOTES: A.  $\overline{RS}$  forces  $\overline{DEN}$ ,  $\overline{WE}$ , and  $\overline{MEN}$  high and places data bus D0 through D15 in a high-impedance state. AB outputs (and program counter) are synchronously cleared to zero after the next complete CLK cycle from  $\overline{RS}\downarrow$ .  
 B.  $\overline{RS}$  must be maintained for a minimum of five clock cycles.  
 C. Resumption of normal program will commence after one complete CLK cycle from  $\overline{RS}\uparrow$ .  
 D. Due to the synchronization action on  $\overline{RS}$ , time to execute the function can vary dependent upon when  $\overline{RS}\uparrow$  or  $\overline{RS}\downarrow$  occur in the CLK cycle.  
 E. Diagram shown is for definition purpose only.  $\overline{DEN}$ ,  $\overline{WE}$ , and  $\overline{MEN}$  are mutually exclusive.  
 F. During a write cycle,  $\overline{RS}$  may produce an invalid write address.

SPRS009C—JANUARY 1987—REVISED JULY 1991

## absolute maximum ratings over specified temperature range (unless otherwise noted)<sup>†</sup>

Supply voltage range,  $V_{PP}$  (see Note 6) ..... -0.6 V to 14 V

<sup>†</sup> Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 6: All voltage values are with respect to  $V_{SS}$ .

## recommended operating conditions

	MIN	NOM	MAX	UNIT
$V_{PP}$ Supply voltage (see Note 11)	12.25	12.5	12.75	V

NOTE 11:  $V_{PP}$  can be applied only to programming pins designed to accept  $V_{PP}$  as an input. During programming the total supply current is  $I_{PP} + I_{CC}$ .

## electrical characteristics over specified temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP <sup>‡</sup>	MAX	UNIT
$I_{PP1}$ $V_{PP}$ supply current	$V_{PP} = V_{CC} = 5.5$ V			100	V
$I_{PP2}$ $V_{PP}$ supply current (during program pulse)	$V_{PP} = 12.75$ V		30	50	V

<sup>‡</sup> All typical values except for  $I_{CC}$  are at  $V_{CC} = 5$  V,  $T_A = 25^\circ\text{C}$ .

## recommended timing requirements for programming, $T_A = 25^\circ\text{C}$ , $V_{CC} = 6$ , $V_{PP} = 12.5$ V, (see Note 13)

	MIN	NOM	MAX	UNIT
$t_w(\text{IPGM})$ Initial program pulse duration	0.95	1	1.05	ms
$t_w(\text{FPGM})$ Final pulse duration	3.8		63	ms
$t_{su}(\text{A})$ Address setup time	2			$\mu\text{s}$
$t_{su}(\text{E})$ $\bar{E}$ setup time	2			$\mu\text{s}$
$t_{su}(\text{G})$ $\bar{G}$ setup time	2			$\mu\text{s}$
$t_{dis}(\text{G})$ Output disable time from $\bar{G}$ (see Note 15)	0		130 <sup>§</sup>	ns
$t_{en}(\text{G})$ Output enable time from $\bar{G}$	0		150 <sup>§</sup>	ns
$t_{su}(\text{D})$ Data setup time	2			$\mu\text{s}$
$t_{su}(\text{VPP})$ $V_{PP}$ setup time	2			$\mu\text{s}$
$t_{su}(\text{VCC})$ $V_{CC}$ setup time	2			$\mu\text{s}$
$t_h(\text{A})$ Address hold time	0			$\mu\text{s}$
$t_h(\text{D})$ Data hold time	2			$\mu\text{s}$

<sup>§</sup> Values derived from characterization data and not tested.

NOTES: 13. For all switching characteristics and timing measurements, input pulse levels are 0.4 V to 2.4 V and  $V_{PP} = 12.5 \text{ V} \pm 0.5 \text{ V}$  during programming.

15. Common test conditions apply for  $t_{dis}(\text{G})$  except during programming.

## PROGRAMMING THE TMS320E15/P15 EPROM CELL

'E15/P15 devices include a  $4K \times 16$ -bit industry-standard EPROM cell for prototyping, early field testing, and low-volume production. In conjunction with this EPROM, the 'E15/P15 with a 4K-word masked ROM, then, provide more migration paths for cost-effective production.

EPROM adapter sockets are available that provide pin-to-pin conversions for programming any 'E15/P15 devices. One adapter socket (part number RTC/PGM320C-06), shown in Figure 8, converts a 40-pin DIP device into an equivalent 28-pin device. Another socket (part number RTC/PGM320A-06), not shown, permits 44- to 28-pin conversion.

**Figure 8. EPROM Adapter Socket (40-pin to 28-pin DIP Conversion)**

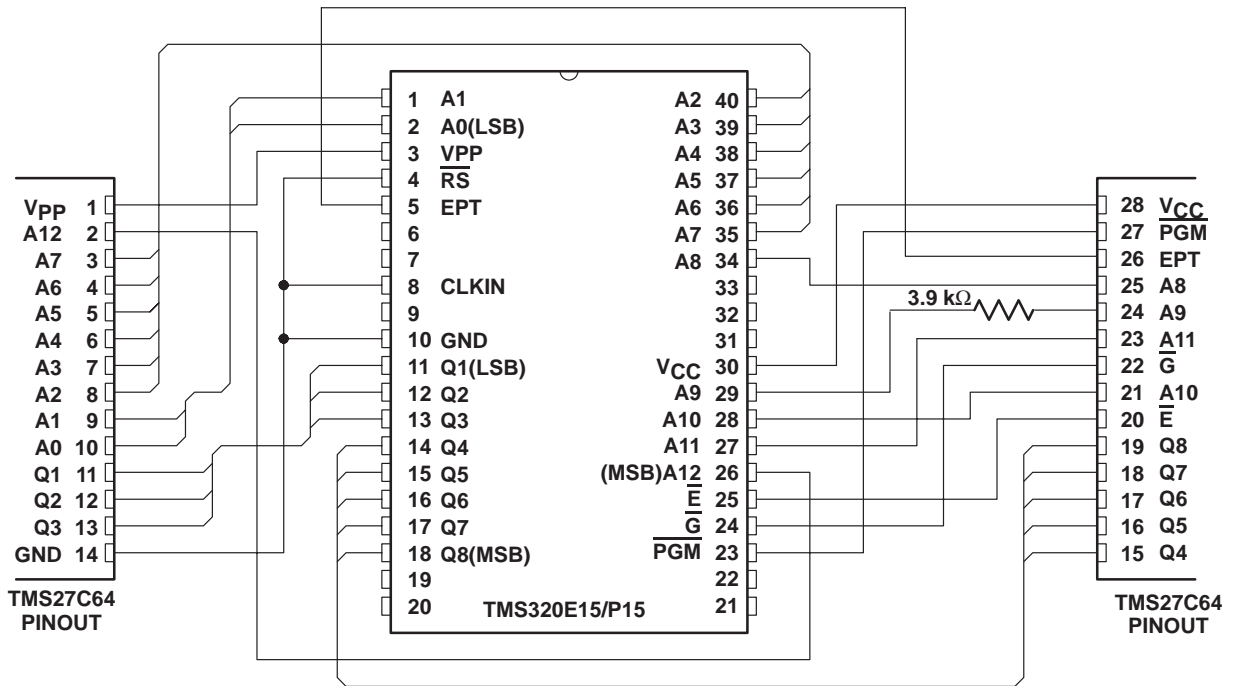

Key features of the EPROM cell include the normal programming operation as well as verification. The EPROM cell also includes a code protection feature that allows code to be protected against copyright violations.

The 'E15/P15 EPROM cell is programmed using the same family and device pinout codes as the TMS27C64  $8K \times 8$ -bit EPROM. The TMS27C64 EPROM series are ultraviolet-light erasable, electrically programmable, read-only memories, fabricated using HVCMOS technology. They are pin-compatible with existing 28-pin ROMs and EPROMs. These EPROMs operate from a single 5-V supply in the read mode; however, a 12.5-V supply is needed for programming. All programming signals are TTL level. For programming outside the system, existing EPROM programmers can be used. Locations may be programmed singly, in blocks, or at random.

Figure 9 shows the wiring conversion to program the 'E15/P15 using the 28-pin pinout of the TMS27C64. Table 5 on pin nomenclature provides a description of the TMS27C64 pins. The code to be programmed into the device should be in serial mode. The 'E15/P15 devices use 13 address lines to address 4K-word memory in byte format.

# TMS320E15, TMS320P15 DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

## CAUTION

Although acceptable by some EPROM programmers, the signature mode cannot be used on any 'E1x device. The signature mode will input a high-level voltage (12.5 V<sub>DC</sub>) onto pin A9. Since this pin is not designed for high voltage, the cell will be damaged. To prevent an accidental application of voltage, Texas Instruments has inserted a 3.9 kΩ resistor between pin A9 of the TI programmer socket and the programmer itself.

## Pin Nomenclature (TMS320E15/P15)

A5	37	5	ADDR	ADDR	ADDR	X	X
A6	36	4	ADDR	ADDR	ADDR	V <sub>IL</sub>	X
A7-A9	35, 34, 29	3, 25, 24	ADDR	ADDR	ADDR	X	X
A10-A12	28-26	21, 23, 2	ADDR	ADDR	ADDR	X	X

**Legend:**

V<sub>IH</sub> = TTL high level; V<sub>IL</sub> = TTL low level; ADDR = byte address bit  
V<sub>PP</sub> = 12.5 V ± 0.25 V; V<sub>CC</sub> = 5 V ± 0.25 V; X = don't care  
PULSE = low-going TTL level pulse; D<sub>IN</sub> = byte to be programmed at ADDR  
Q<sub>OUT</sub> = byte stored at ADDR; RBIT = ROM protect bit.

**programming**

Since every memory bit in the cell is a logic 1, the programming operation reprograms certain bits to 0. Once programmed, these bits can only be erased using ultraviolet light. The correct byte is placed on the data bus with V<sub>PP</sub> set to the 12.5 V level. The PGM pin is then pulsed low to program in the zeros.

**erasure**

Before programming, the device must be erased by exposing it to ultraviolet light. The recommended minimum exposure dose (UV-intensity × exposure-time) is 15 W•s/cm<sup>2</sup>. A typical 12-mW/cm<sup>2</sup>, filterless UV lamp will erase the device in 21 minutes. The lamp should be located about 2.5 cm above the chip during erasure. After exposure, all bits are in the high state.

**verify/read**

To verify correct programming, the EPROM cell can be read using either the verify or read line definitions shown in Table 5, assuming the inhibit bit has not been programmed.

**program inhibit**

Programming may be inhibited by maintaining a high level input on the  $\overline{E}$  pin or  $\overline{PGM}$  pin.

**read**

The EPROM contents may be read independent of the programming cycle, provided the RBIT (ROM protect bit) has not been programmed. The read is accomplished by setting  $\overline{E}$  to zero and pulsing  $\overline{G}$  low. The contents of the EPROM location selected by the value on the address inputs appear on Q8-Q1.

# TMS320E15, TMS320P15 DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

## output disable

During the EPROM programming process, the EPROM data outputs may be disabled, if desired, by establishing the output disable state. This state is selected by setting  $\bar{G}$  and  $\bar{E}$  pins high. While output disable is selected, Q8-Q1 are placed in the high-impedance state.

## EPROM protection

To protect the proprietary algorithms existing in the code programmed on-chip, the ability to read or verify code from external accesses can be completely disabled. Programming the RBIT disables external access of the EPROM cell and disables the microprocessor mode, making it impossible to access the code resident in the EPROM cell. The only way to remove this protection is to erase the entire EPROM cell, thus removing the proprietary information. The signal requirements for programming this bit are shown in Table 5. The cell can be determined as protected by verifying the programming of the RBIT shown in the table.

## standard programming procedure

Before programming, the device must first be completely erased. Then the device can be programmed with the correct code. It is advisable to program unused sections with zeroes as a further security measure. After the programming is complete, the code programmed into the cell should be verified. If the cell passes verification, the next step is to program the ROM protect bit (RBIT). Once the RBIT programming is verified, an opaque label should be placed over the window to protect the EPROM cell from inadvertent erasure by ambient light. At this point, the programming is complete, and the device is ready to be placed into its destination circuit.

## program cycle timing

**absolute maximum ratings over specified temperature range (unless otherwise noted)†**

Supply voltage range, $V_{CC}$ (see Note 6)	-0.3 V to 4.6 V
Input voltage range	-0.3 V to $V_{CC} + 0.5$
Output voltage range	-0.3 V to $V_{CC} + 0.5$
Continuous power dissipation	75 mW
Air temperature range above operating devices: L version	0°C to 70°C
A version	-40°C to 85°C
Storage temperature range	-55°C to +150°C

† Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 6: All voltage values are with respect to  $V_{SS}$ .

**recommended operating conditions**

SPRS009C—JANUARY 1987—REVISED JULY 1991

## INTERNAL CLOCK OPTION

## PARAMETER MEASUREMENT INFORMATION

Figure 10. Test Load Circuit

## CLOCK CHARACTERISTICS AND TIMING

The 'LC15 can use either its internal oscillator or an external frequency source for a clock.

### internal clock option

The internal oscillator is enabled by connecting a crystal across X1 and X2/CLKIN (see Figure 1). The frequency of CLKOUT is one-fourth the crystal fundamental frequency. The crystal should be fundamental mode, and parallel resonant, with an effective series resistance of 30 ohms, a power dissipation of 1 mW, and be specified at a load capacitance of 20 pF.

PARAMETER	TEST CONDITIONS	MIN	NOM	MAX	UNIT
Crystal frequency $f_x$	$T_A = -40^\circ\text{C}$ to $85^\circ\text{C}$	4.0		16	MHz
C1, C2			10		pF

### external clock option

An external frequency source can be used by injecting the frequency directly into X2/CLKIN with X1 left unconnected. The external frequency injected must conform to the specifications listed in the table below.

### switching characteristics over recommended operating conditions

PARAMETER	TEST CONDITIONS	MIN	NOM	MAX	UNIT
$t_{c(C)}$ CLKOUT cycle time <sup>†</sup>	$R_L = 825 \Omega$ , $C_L = 100 \text{ pF}$ , (see Figure 2)	250		1000	ns
$t_{r(C)}$ CLKOUT rise time			10 <sup>‡</sup>		ns
$t_{f(C)}$ CLKOUT fall time				8 <sup>‡</sup>	ns
$t_{w(CL)}$ Pulse duration, CLKOUT low				117 <sup>‡</sup>	ns
$t_{w(CH)}$ Pulse duration, CLKOUT high				115 <sup>‡</sup>	ns
$t_{d(MCC)}$ Delay time, CLKIN <sup>↑</sup> to CLKOUT <sup>↓</sup>			20		70

### timing requirements over recommended operating conditions

	MIN	NOM	MAX	UNIT
$t_{c(MC)}$ Master clock cycle time	62.5		150	ns
$t_{r(MC)}$ Rise time, master clock input		5 <sup>‡</sup>	10 <sup>†</sup>	ns
$t_{f(MC)}$ Fall time, master clock input		5 <sup>‡</sup>	10 <sup>†</sup>	ns
$t_{w(MCP)}$ Pulse duration, master clock	0.4 $t_{c(MC)}$ <sup>‡</sup>		0.6 $t_{c(MC)}$ <sup>‡</sup>	ns
$t_{w(MCL)}$ Pulse duration, master clock low at $t_{c(MC)}$ min		26		ns
$t_{w(MCH)}$ Pulse duration, master clock high at $t_{c(MC)}$ min		26		ns

<sup>†</sup>  $t_{c(C)}$  is the cycle time of CLKOUT, i.e., 4 $t_{c(MC)}$  (4 times CLKIN cycle time if an external oscillator is used)

<sup>‡</sup> Values derived from characterization data and not tested.

# TMS320LC15 DIGITAL SIGNAL PROCESSOR

SPRS009C—JANUARY 1987—REVISED JULY 1991

## electrical characteristics over specified temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP†	MAX	UNIT
$I_{CC}^{\ddagger}$	$f = 16.0 \text{ MHz}, V_{CC} = 3.6 \text{ V}, T_A = 0^\circ\text{C to } 70^\circ\text{C}$		15	20	mA

† All typical values are at  $T_A = 70^\circ\text{C}$  and are used for thermal resistance calculations.

‡  $I_{CC}$  characteristics are inversely proportional to temperature. For  $I_{CC}$  dependence on frequency, see figure below.

### typical power vs. frequency graph (outputs unloaded)§

§ Device operation is not guaranteed below 4 MHz CLKIN.  
Graph is for device in RESET; i.e., only clock-out is driven.

**MEMORY AND PERIPHERAL INTERFACE TIMING**

**switching characteristics over recommended operating conditions**

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{d1}$ Delay time CLKOUT $\downarrow$ to address bus valid	$R_L = 825\Omega$ , $C_L = 100\text{ pF}$ , (see Figure 2)	10 $\uparrow$	75	ns
$t_{d2}$ Delay time CLKOUT $\downarrow$ to $\overline{\text{MEN}}\downarrow$		$1/4 t_{c(C)} - 5\uparrow$	$1/4 t_{c(C)} + 25$	ns
$t_{d3}$ Delay time CLKOUT $\downarrow$ to $\overline{\text{MEN}}\uparrow$		-10 $\uparrow$	30	ns

# TMS320LC15 DIGITAL SIGNAL PROCESSOR

SPRS009C—JANUARY 1987—REVISED JULY 1991

## reset timing

- NOTES: A.  $\overline{RS}$  forces  $\overline{DEN}$ ,  $\overline{WE}$ , and  $\overline{MEN}$  high and places data bus D0 through D15 in a high-impedance state. AB outputs (and program counter) are synchronously cleared to zero after the next complete CLK cycle from  $\overline{RS}\downarrow$ .
- B.  $\overline{RS}$  must be maintained for a minimum of five clock cycles.
- C. Resumption of normal program will commence after one complete CLK cycle from  $\overline{RS}\uparrow$ .
- D. Due to the synchronization action on  $\overline{RS}$ , time to execute the function can vary dependent upon when  $\overline{RS}\uparrow$  or  $\overline{RS}\downarrow$  occur in the CLK cycle.
- E. Diagram shown is for definition purpose only.  $\overline{DEN}$ ,  $\overline{WE}$ , and  $\overline{MEN}$  are mutually exclusive.
- F. During a write cycle,  $\overline{RS}$  may produce an invalid write address.

† Input/Output/High-impedance state.

**TERMINAL FUNCTIONS (concluded)**

PIN		I/O/Z†	DESCRIPTION
NAME	NO.		
<b>INTERRUPT AND MISCELLANEOUS SIGNALS</b>			
$\overline{\text{BIO}}$	64	I	External polling input. Polled by BIOZ instruction. If low, the device branches to the address specified by the instruction.
$\overline{\text{IOEN}}$	54	O	Data enable for device input data. When active (low), $\overline{\text{IOEN}}$ indicates that the device will accept data from the data bus. $\overline{\text{IOEN}}$ is active only during the IN instruction. When $\overline{\text{IOEN}}$ is active, $\overline{\text{MEN}}$ , $\overline{\text{IOWE}}$ , and $\overline{\text{MWE}}$ will always be inactive (high).
$\overline{\text{IOWE}}$	52	O	Write enable for device output data. When active (low), $\overline{\text{IOWE}}$ indicates that data will be output from the device on the data bus. $\overline{\text{IOWE}}$ is active only during the OUT instruction. When $\overline{\text{IOWE}}$ is active, $\overline{\text{MEN}}$ , $\overline{\text{IOEN}}$ , and $\overline{\text{MWE}}$ will always be inactive (high).
$\overline{\text{INT}}$	63	I	External interrupt input. The interrupt signal is generated by applying a negative-going edge to the INT pin. The edge is used to latch the interrupt flag register (INTF) until an interrupt is granted by the device. An active low level will also be sensed.
$\overline{\text{MC/MP}}$	62	I	Memory mode select pin. High selects the microcomputer mode, in which 8K words of on-chip program memory are available. A low on $\overline{\text{MC/MP}}$ pin enables the microprocessor mode. In this mode, the entire memory space is external; i.e., addresses 0 through 65535.
$\overline{\text{MEN}}$	56	O	Memory enable. $\overline{\text{MEN}}$ is an active (low) control signal generated by the device to enable instruction fetches from program memory. $\overline{\text{MEN}}$ will be active on instructions fetched from both internal and external memory. When $\overline{\text{MEN}}$ is active, $\overline{\text{MWE}}$ , $\overline{\text{IOWE}}$ , and $\overline{\text{IOEN}}$ will be inactive (high).
$\overline{\text{MWE}}$	53	O	Write enable for device output data. When active (low), $\overline{\text{MWE}}$ indicates that data will be output from the device on the data bus. $\overline{\text{MWE}}$ is active only during the TBLW instruction. When $\overline{\text{MWE}}$ is active, $\overline{\text{MEN}}$ , $\overline{\text{IOEN}}$ , and $\overline{\text{IOWE}}$ will always be inactive (high).
NC	1, 12, 18, 19, 24, 29, 33, 50, 51, 55	—	No connection.
$\overline{\text{RS}}$	2	I	Schmitt-triggered input for initializing the device. When held active for a minimum of five clock cycles, $\overline{\text{IOEN}}$ , $\overline{\text{IOWE}}$ , $\overline{\text{MWE}}$ , and $\overline{\text{MEN}}$ are forced high; and, the data bus (D15 through D0) is not driven. The program counter (PC) and the address bus (A15 through A0) are then synchronously cleared after the next complete clock cycle from the falling edge of $\overline{\text{RS}}$ . Reset also disables the interrupt, clears the interrupt flag register, and leaves the overflow mode register unchanged. The device can be held in the reset state indefinitely.
<b>SUPPLY/OSCILLATOR SIGNALS</b>			
PIN		I/O/Z†	DESCRIPTION
NAME	NO.		
CLKOUT	9	O	System clock output (one-fourth crystal/CLKIN frequency).
$V_{\text{DD}}$	26, 57, 58, 59, 60	I	5-V supply pins.
$V_{\text{SS}}$	5, 6, 7, 8, 42, 61	I	Ground pins.
X1	3	O	Crystal output pin for internal oscillator. If the internal oscillator is not used, this pin should be left unconnected.
X2/CLKIN	4	I	Input pin to the internal oscillator (X2) from the crystal. Alternatively, an input pin for an external oscillator (CLKIN).

† Input/Output/High-impedance state.

## TBLW instruction timing

reset timing

- NOTES: A.  $\overline{RS}$  forces  $\overline{IOEN}$ ,  $\overline{IOWE}$ ,  $\overline{MWE}$ , and  $\overline{MEN}$  high and places data bus D0 through D15 in a high-impedance state. AB outputs (and program counter) are synchronously cleared to zero after the next complete CLK cycle from  $\overline{RS}\downarrow$ .
- B.  $\overline{RS}$  must be maintained for a minimum of five clock cycles.
- C. Resumption of normal program will commence after one complete CLK cycle from  $\overline{RS}\uparrow$ .
- D. Due to the synchronization action on  $\overline{RS}$ , time to execute the function can vary dependent upon when  $\overline{RS}\uparrow$  or  $\overline{RS}\downarrow$  occur in the CLK cycle.
- E. Diagram shown is for definition purpose only.  $\overline{IOEN}$ ,  $\overline{IOWE}$ ,  $\overline{MWE}$ , and  $\overline{MEN}$  are mutually exclusive.
- F. During a write cycle,  $\overline{RS}$  may produce an invalid write address.

# TMS320C16 DIGITAL SIGNAL PROCESSOR

SPRS009C—JANUARY 1987—REVISED JULY 1991

## design considerations for interfacing to SRAM, EPROM and peripherals

The 'C16 differs somewhat from the other members of the 'C1x family of digital signal processors (DSPs). Additional control signals are available for easier interface to external memory or peripherals, and the memory write cycle timings have been changed.

The discussion here will center around changes in  $t_v$  and its impact upon SRAM, EPROM and peripherals/latches interfaces.

Access time requirements for interface may be defined relative to :

1. Valid address ( $t_a$ );
2.  $\overline{MEN}/\overline{IOEN}$ , [ $t_a(\overline{MEN})$ ];

Figure 11 and the following examples summarize these timings at 35 MHz CLKIN.

Figure 11.

where:

$$t_a : (\text{access time from address valid}) = t_c(C) - t_{d1} - t_{su}(D) = 44.3 \text{ ns}$$

$$t_a(\overline{MEN}) : (\text{access time from } \overline{MEN} \text{ valid}) = t_c(C) - t_{d2} - t_{su}(D) + t_{d3} = 35.73 \text{ ns}$$

and where (for 35 MHz CLKIN):

$$t_c(C) = 114.3 \text{ ns}$$

$$t_{d1} = 35 \text{ ns}$$

$$t_{d2} = [1/4 \times (114.3) + 12] \text{ ns}$$

$$t_{su}(D) = 35 \text{ ns}$$

$$t_w(\text{CH}) = 47 \text{ ns nominal}$$

$$t_f(C) = 8 \text{ ns nominal}$$

In addition to the above timings,  $t_v$  must be taken into account.  $t_v$  is the time that the data bus is guaranteed to be held after the rising edge of  $\overline{MWE}$  or  $\overline{IOWE}$ . In other 'C1x devices, the value of  $t_v$  was referenced to  $\text{CLKOUT}\downarrow$  and not  $\overline{WE}\uparrow$  (see Figure 12). For the 'C16,  $t_v$  is a minimum of 5 ns. This implies that  $\overline{MWE}$  and  $\overline{IOWE}$  must be tied directly to the external device. If required, decode logic must be added to an input other than the read/write input — for example, the chip select on SRAMs. If the external device does not have two inputs, then transparent latches must be added to extend the time data is held on the data bus. These latches must be off the bus prior to the next instruction (see Figure 12).

Figure 12.

where:

$$t_v = 5 \text{ ns (min)}$$

$$t_{d10} = 15 \text{ ns (max)}$$

There is a potential for bus conflict on the prefetch and execution of a TBLW or an OUT instruction. Figure 13 details the timings to be considered. In addition to the timings for the 'C16, timing definitions for interface are also included.

Figure 13.

where:

# TMS320C16 DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

$$t_{\text{conf}} \text{ (data bus conflict time)} = t_{\text{ddeco}} + t_{\text{dmemh}} - t_{\text{d9(MEN)}}$$

with:

- $t_{\text{ddeco}}$  : decode delay time to make the CE or OE signal
- $t_{\text{dmemh}}$  : memory data hold time from CE or OE
- $t_{\text{d9}}$  : delay time,  $\overline{\text{MEN}}$  to data bus starts being driven
- $t_{\text{d9}}$  : (at 35 MHz CLKIN) =  $[1/4t_{\text{C(C)}}] = [1/4(114.3)] = 28.58 \text{ ns}$

If  $t_{\text{conf}}$  is less than or equal to zero, data bus conflict does not occur.

If  $t_{\text{conf}}$  is greater than zero, data conflict occurs.

Note that the following discussion is for CLKIN of 35 MHz.

## static memory with output enable and write enable/chip select

The following SRAMs are able to interface directly to the 'C16, needing only to directly connect the 'C16 memory control signals  $\overline{\text{MEN}}$  and  $\overline{\text{MWE}}$  to the memory. Device select decode is accomplished with address decode and then input to the device chip select.

PRODUCT	$t_{\text{ddeco}}$	$t_{\text{dmemh}}$	$t_{\text{dconf}}$	UNITS
TC55645-35	0	15	-13.58	ns
TC55328-35	0	15	-13.58	ns
TMS6789-35	0	8	-20.58	ns
TC5588-35	0	10	-18.58	ns
TMS6716-35	0	10	-18.58	ns

Figure 14.

**static memory with chip enable and write enable**

Without a separate output enable, a faster SRAM is required. Logic is added to decode address and memory control to perform a read/write cycle. The  $\overline{MWE}$  signal is directly connected to the WE input of the SRAM to meet the  $t_v$  specification (see Figure 15).

Figure 15.

**EPROM interface**

The following high-speed EPROMs can be used directly:

Product	$t_{d\text{deco}}$	$t_{d\text{memh}}$	$t_{d\text{conf}}$	Units
CY7C291-35	0	25	- 3.58	ns
TMS27C291-35	0	25	- 3.58	ns

## interfacing latches to the TMS320C16

As with the previous devices, the memory control signal must be directly connected to the latch and the latch needs to have a separate chip select. There are several devices with this feature, including the SN74ALS996. The SN74ALS996 is an 8-bit D-type edge-triggered read-back latch with three-state outputs, connected to the 'C16 as illustrated in Figure 17.

## architecture

The 'C17/E17/LC17/P17 consists of five major functional units: the 'C15 microcomputer, a system control register, a full-duplex dual-channel serial port, companding hardware, and a coprocessor port.

Three of the I/O ports are used by the serial port, companding hardware, and the coprocessor port. Their operation is determined by the 32 bits of the system control register (see Table 6 for the control register bit definitions). Port 0 accesses control register 0 and consists of the lower 16 register bits (CR15-CR0), and is used to control the interrupts, serial port connections, and companding hardware operation. Port 1 accesses control register 1, consisting of the upper 16 control bits (CR31-CR16), as well as both serial port channels, the companding hardware, and the coprocessor port channels. Communication with the control register is via IN and OUT instructions to ports 0 and 1.

Interrupts fully support the serial port interface. Four maskable interrupts ( $\overline{\text{EXINT}}$ ,  $\overline{\text{FR}}$ ,  $\overline{\text{FSX}}$ , and  $\overline{\text{FSR}}$ ) are mapped into I/O port 0 via control register 0. When disabled, these interrupts may be used as single-bit logic inputs polled by software.

## serial port

The dual-channel serial port is capable of full-duplex serial communication and offers direct interface to two combo-codecs. Two receive and two transmit registers are mapped into I/O port 1, and operate with 8-bit data samples. Internal and external framing signals for serial port transfers (MSB first) are selected via the system control register. The serial port clock, SCLK, provides the bit timing for transfers with the serial port, and may be either an input or output. As an input, an external clock provides the timing for data transfers and framing pulse synchronization. As an output, SCLK provides the timing for standalone serial communication and is derived from the 'C17/E17/P17 system clock, X2/CLKIN, and system control register bits CR27-CR24 (see Table 7 for the available divide ratios). The internal framing (FR) pulse frequency is derived from the serial port clock (SCLK) and system control register bits CR23-CR16. This framing pulse signal provides framing pulses for combo-codecs, for a sample clock for voice-band systems, or for a timer used in control applications.

## $\mu$ -law/A-law companding hardware

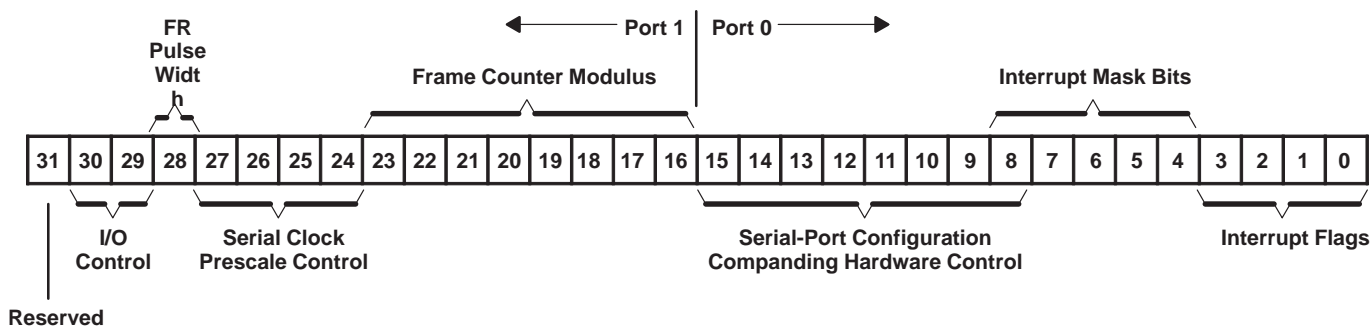

The 'C17/E17/LC17/P17 features hardware companding logic and can operate in either  $\mu$ -law or A-law format with either sign-magnitude or twos-complement numbers. Data may be companded in either a serial mode for operation on serial port data or a parallel mode for computation inside the device. The companding logic operation is selected through CR14. No bias is required when operating in twos-complement. A bias of 33 is required for sign-magnitude in  $\mu$ -law companding. Upon reset, the device is programmed to operate in sign-magnitude mode. This mode can be changed by modifying control bit 29 (CR29) in control register 1. For further information on companding, see the *TCM29C13/TCM29C14/TCM29C16/TCM29C17 Combined Single-Chip PCM Codec and Filter Data Sheet*, and the application report, "Companding Routines for the TMS32010/TMS32020," in the book *Digital Signal Processing Applications with the TMS320 Family* (SPRA012A), both documents published by Texas Instruments.

In the serial mode, sign-magnitude linear PCM (13 magnitude bits plus 1 sign bit for  $\mu$ -law format or 12 magnitude bits plus 1 sign bit for A-law format) is compressed to 8-bit sign-magnitude logarithmic PCM by the encoder and sent to the transmit register for transmission on an active framing pulse. The decoder converts 8-bit sign-magnitude log PCM from the serial port receive registers to sign-magnitude linear PCM.

In the parallel mode, the serial port registers are disabled to allow parallel data from internal memory to be encoded or decoded for computation inside the device. In the parallel encode mode, the encoder is enabled and a 14-bit sign-magnitude value written to port 1. The encoded value is returned with an IN instruction from port 1. In the parallel decode mode, the decoder is enabled and an 8-bit sign-magnitude log PCM value is written to port 1. On the successive IN instruction from port 1, the decoded value is returned. At least one instruction should be inserted between an OUT and the successive IN when companding is performed with twos-complement values.

Table 6. Control Register Configuration

BIT	DESCRIPTION AND CONFIGURATION
0	$\overline{\text{EXINT}}$ interrupt flag <sup>†</sup>
1	$\overline{\text{FSR}}$ interrupt flag <sup>†</sup>
2	$\overline{\text{FSX}}$ interrupt flag <sup>†</sup>
3	FR interrupt flag <sup>†</sup>
4	$\overline{\text{EXINT}}$ interrupt enable mask. When set to logic 1, an interrupt on $\overline{\text{EXINT}}$ activates device interrupt circuitry.
5	$\overline{\text{FSR}}$ interrupt enable mask. Same as $\overline{\text{EXINT}}$ control.
6	$\overline{\text{FSX}}$ interrupt enable mask. Same as $\overline{\text{EXINT}}$ control.
7	FR interrupt enable mask. Same as $\overline{\text{EXINT}}$ control.
8	Port 1 configuration control: 0 = port 1 connects to either serial-port registers or companding hardware. 1 = port 1 accesses CR31-CR16.
9	External framing enable: 0 = serial-port data transfers controlled by active FR. 1 = serial-port data transfers controlled by active $\overline{\text{FSX}}/\overline{\text{FSR}}$ .
10	XF external logic output flag latch
11	Serial-port enable: 0 = Parallel companding mode; serial port disabled. 1 = serial companding mode; serial port registers enabled.
12	$\mu$ -law/A-law encoder enable: 0 = disabled. 1 = data written to port 1 is $\mu$ -law or A-law encoded.
13	$\mu$ -law/A-law decoder enable: 0 = disabled. 1 = data written to port 1 is $\mu$ -law or A-law decoded.
14	$\mu$ -law/A-law decoder encode/decoded select: 0 = companding hardware performs $\mu$ -law conversion. 1 = companding hardware performs A-law conversion.
15	Serial clock control: 0 = SCLK is an output, derived from the prescaler in timing logic. 1 = SCLK is an input that provides the clock for serial port and frame counter in timing logic.
23-16	Frame counter modulus. Controls FR frequency = $\text{SCLK}/(\text{CNT} + 2)$ where CNT is binary value fo CR23-CR16 <sup>‡</sup>
27-24	SCLK prescale cotnrol bits. (See Table 7 for divide ratios.)
28	FR pulse-width control: 0 = fixed-data rate; FR is 1 SCLK cycle wide. 1 = variable-data rate; FR is 8 SCLK cycles wide.
29	Two's-complement $\mu$ -law/A-law conversion enable: 0 = sign-magnitude companding 1 = twos-complement companding
30	8/16-bit length coprocessor mode select: 0 = 8-bit byte length 1 = 16-bit word length
31	Reserved for future expansion: Should be set to zero.

<sup>†</sup> Interrupt flag is cleared by writing a logic 1 to the bit with an OUT instruction to port 0.

<sup>‡</sup> All ones in CR23-CR16 indicate a degenerative state and should be avoided. Bits are operational whether SCLK is an input or an output. CNT must be greater than 7.

1	0	1	0	12	1.706	MHz
1	1	0	0	10	2.048	MHz

The specification for  $\mu$ -law and A-law log PCM coding is part of the CCITT G.711 recommendation. The following diagram shows a 'C17/E17/P17 interface to two codecs as used for  $\mu$ -law or A-law companding format.

## coprocessor port

The coprocessor port, accessed through I/O port 5 using IN and OUT instructions, provides a direct connection to most 4/8-bit microcomputers and 16/32-bit microprocessors. The coprocessor interface allows the 'C17/E17/P17 to act as a peripheral (slave) microcomputer to a microprocessor, or a master to a peripheral microcomputer such as TMS7042. The coprocessor port is enabled by setting  $\overline{MC/PM}$  and MC low. The microcomputer mode is enabled by setting these two pins high. (Note that  $\overline{MC/PM} \neq MC$  is undefined.) In the microcomputer mode, the 16 data lines are used for the 6 parallel 16-bit I/O ports.

In the coprocessor mode, the 16-bit coprocessor port is reconfigured to operate as a 16-bit latched bus interface. Control bit 30 (CR30) in control register 1 is used to configure the coprocessor port to either an 8-bit or a 16-bit length. When CR30 is high, the coprocessor port is 16 bits wide thereby making all 16 bits of the data port available for 16-bit transfers to 16 and 32-bit microprocessors. When CR30 is low, the port is 8-bits wide and mapped to the low byte of the data port for interfacing to 8-bit microcomputers. When operating in the 8-bit mode, both halves of the 16-bit latch can be addressed using the HI/LO pin, thus allowing 16-bit transfers over 8 data lines. When not in the coprocessor mode, port 5 can be used as a generic I/O port.

**coprocessor port (continued)**

The external processor recognizes the coprocessor interface in which both processors run asynchronously as a memory-mapped I/O operation. The external processor lowers the  $\overline{WR}$  line and places data on the bus. It next raises the  $\overline{WR}$  line to clock the data into the on-chip latch. The rising edge of  $\overline{WR}$  automatically creates an interrupt to the 'C17/E17/P17, and the falling edge of  $\overline{WR}$  clears the  $\overline{RBLE}$  (receive buffer latch empty) flag. When the 'C17/E17/P17 reads the coprocessor port, it causes the  $\overline{RBLE}$  signal to transition to a logic low state that clears the data in the latch, and allows the interrupt condition to be cleared internally. Likewise, the external processor reads from the latch by driving the  $\overline{RD}$  line active low, thus enabling the output latch to drive the latched data. When the data has been read, the external device will again bring the  $\overline{RD}$  line high. This activates the  $\overline{BIO}$  line to signal that the transfer is complete and the latch is available for the next transfer. The falling edge of  $\overline{RD}$  resets the  $\overline{TBLF}$  (transmit buffer latch full) flag. Note that the  $\overline{EXINT}$  and  $\overline{BIO}$  lines are reserved for coprocessor interface and cannot be driven externally when in the coprocessor mode.

An example of the use of a coprocessor interface is shown in Figure 18, in which the 'C17/E17/P17 are DSPs interfaced to the TMS70C42, an 8-bit microcontroller.

SPRS009C—JANUARY 1987—REVISED JULY 1991

## electrical specifications

This section contains the electrical specifications for all versions of the 'C17/E17/P17 digital signal processors, including test parameter measurement information. Parameters with  $_{pp}$  subscripts apply only to the 'E17/P17 in the EPROM programming mode (see Note 11).

### absolute maximum ratings over operating free-air temperature range (unless otherwise noted)<sup>†</sup>

Supply voltage range, $V_{CC}$ , except for the '320LC17 (see Note 6)	–0.3 V to 7 V
Supply voltage range, $V_{PP}$	–0.6 V to 14 V
Input voltage range	–0.3 V to 14 V
Output voltage range	–0.3 V to 7 V
Continuous power dissipation	1.5 W
Operating free-air temperature: L suffix	0°C to 70°C
A suffix	–40°C to 85°C
Storage temperature	–55°C to 150°C

<sup>†</sup> Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 6: All voltage values are with respect to  $V_{SS}$ .

### recommended operating conditions

		MIN	NOM	MAX	UNIT
$V_{CC}$ Supply voltage	EPROM devices	4.75	5	5.25	V
	All other devices	4.5	5	5.5	V
$V_{PP}$ Supply voltage (see Note 11)		12.25	12.5	12.75	V
$V_{SS}$ Supply voltage			0		V
$V_{IH}$ High-level input voltage	All inputs except CLKIN	2			V
	CLKIN	3			V
$V_{IL}$ Low-level input voltage	All inputs except $\overline{MC/MP}$			0.8	V
	$\overline{MC/MP}$			0.6	V
$I_{OH}$ High-level output current, all outputs				–300	$\mu$ A
$I_{OL}$ Low-level output current (All outputs)				2	mA
$T_A$ Operating free-air temperature	L suffix	0		70	°C
	A suffix	–40		85	°C

NOTE 11:  $V_{PP}$  can be applied only to programming pins designed to accept  $V_{PP}$  as an input. During programming the total supply current is  $I_{PP} + I_{CC}$ .

**electrical characteristics over specified temperature range (unless otherwise noted)**

PARAMETER		TEST CONDITIONS	MIN	TYP†	MAX	UNIT
I <sub>CC</sub> ‡ Supply current	TMS320C17	f = 20.5 MHz, V <sub>CC</sub> = 5.5 V, T <sub>A</sub> = 0°C to 70°C		50	65	mA
	TMS320E17/P17	f = 25.6 MHz, V <sub>CC</sub> = 5.5 V, T <sub>A</sub> = – 40°C to 85°C		55	75	

† All typical values are at T<sub>A</sub> = 70°C and are used for thermal resistance calculations.

‡ I<sub>CC</sub> characteristics are inversely proportional to temperature. For I<sub>CC</sub> dependance on temperature, frequency, and loading, see Figure 3.

**CLOCK CHARACTERISTICS AND TIMING**

The 'C17/E17/P17 can use either its internal oscillator or an external frequency source for a clock.

**internal clock option**

The internal oscillator is enabled by connecting a crystal across X1 and X2/CLKIN (see Figure 1). The frequency of CLKOUT is one-fourth the crystal fundamental frequency. The crystal should be fundamental mode, and parallel resonant, with an effective series resistance of 30 ohms, a power dissipation of 1 mW, and should be specified at a load capacitance of 20 pF.

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
Crystal frequency, f <sub>x</sub>	TMS320C17	T <sub>A</sub> = 0°C to 70°C	6.7		20.5	MHz
	TMS320E17/P17	T <sub>A</sub> = – 40°C to 85°C	6.7		20.5	
C1, C2		T <sub>A</sub> = 0°C to 70°C		10		pF

**external clock option**

An external frequency source can be used by injecting the frequency directly into X2/CLKIN with X1 left unconnected. The external frequency injected must conform to the specifications listed in the table below.

**switching characteristics over recommended operating conditions**

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
t <sub>c(C)</sub>	CLKOUT cycle time§	R <sub>L</sub> = 825 Ω, C <sub>L</sub> = 100 pF (see Figure 2)	195.12	200		ns
t <sub>r(C)</sub>	CLKOUT rise time			10¶		ns
t <sub>f(C)</sub>	CLKOUT fall time			8¶		ns
t <sub>w(CL)</sub>	Pulse duration, CLKOUT low			92¶		ns
t <sub>w(CH)</sub>	Pulse duration, CLKOUT high			90¶		ns
t <sub>d(MCC)</sub>	Delay time, CLKIN↑ to CLKOUT↓			25¶		60¶

§ t<sub>c(C)</sub> is the cycle time of CLKOUT, i.e., 4t<sub>c(MC)</sub> (4 times CLKIN cycle time if an external oscillator is used).

## EPROM PROGRAMMING

### absolute maximum ratings over specified temperature range (unless otherwise noted)†

Supply voltage range,  $V_{PP}$  (see Note 6) ..... -0.6 V to 14 V

† Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 6: All voltage values are with respect to GND.

### recommended operating conditions

	MIN	NOM	MAX	UNIT
$V_{PP}$ Supply voltage (see Note 11)		12.5	12.75	V

NOTE 11:  $V_{PP}$  can be applied only to programming pins designed to accept  $V_{PP}$  as an input. During programming the total supply current is  $I_{PP} + I_{CC}$ .

### electrical characteristics over specified temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP†	MAX	UNIT
$I_{PP1}$ $V_{PP}$ supply current	$V_{PP} = V_{CC} = 5.5$ V			100	$\mu$ A
$I_{PP2}$ $V_{PP}$ supply current (during program pulse)	$V_{PP} = 12.75$ V, $V_{CC} = 5.5$ V		30	50	mA

### recommended timing requirements for programming, $T_A = 25^\circ\text{C}$ , $V_{CC} = 6$ V, $V_{PP} = 12.5$ V, (see Note 13)

	MIN	NOM	MAX	UNIT
$t_w(\text{IPGM})$ Initial program pulse duration	0.95	1	1.05	ms
$t_w(\text{FPGM})$ Final pulse duration	3.8		63	ms
$t_{su}(\text{A})$ Address setup time	2			$\mu$ s
$t_{su}(\text{E})$ $\bar{\text{E}}$ setup time	2			$\mu$ s
$t_{su}(\text{G})$ $\bar{\text{G}}$ setup time	2			$\mu$ s
$t_{dis}(\text{G})$ Output disable time from $\bar{\text{G}}$ (see Note 15)	0		130†	ns
$t_{en}(\text{G})$ Output enable time from $\bar{\text{G}}$			150†	ns
$t_{su}(\text{D})$ Data setup time	2			$\mu$ s
$t_{su}(\text{VPP})$ $V_{PP}$ setup time	2			$\mu$ s
$t_{su}(\text{VCC})$ $V_{CC}$ setup time	2			$\mu$ s
$t_h(\text{A})$ Address hold time	0			$\mu$ s
$t_h(\text{D})$ Data hold time	2			$\mu$ s

† Values derived from characterization data and not tested.

NOTES: 13. For all switching characteristics and timing measurements, input pulse levels are 0.4 V to 2.4 V and  $V_{PP} = 12.5$  V  $\pm$  0.25 V during programming.

15. Common test conditions apply for  $t_{dis}(\text{G})$  except during programming.

## PROGRAMMING THE TMS320E17/P17 EPROM CELL

Each 'E17/P17 devices include a 4K × 16-bit industry-standard EPROM cell for prototyping, early field testing, and low-volume production. In conjunction with this EPROM, the TMS320C17 with a 4K-word masked ROM, then, provides more migration paths for cost-effective production.

Note: The TMS320P17 is a one-time programmable (OTP) EPROM device.

EPROM adapter sockets are available that provide pin-to-pin conversions for programming any 'E17/P17 devices. One adapter socket (part number RTC/PGM320C-06), shown in Figure 19, converts a 40-pin DIP into an equivalent 28-pin device. Another socket (part number RTC/PGM320C-06), not shown, permits 44- to 28-pin conversion.

**Figure 19. EPROM Adapter Socket (40-Pin to 28-Pin DIP Conversion)**

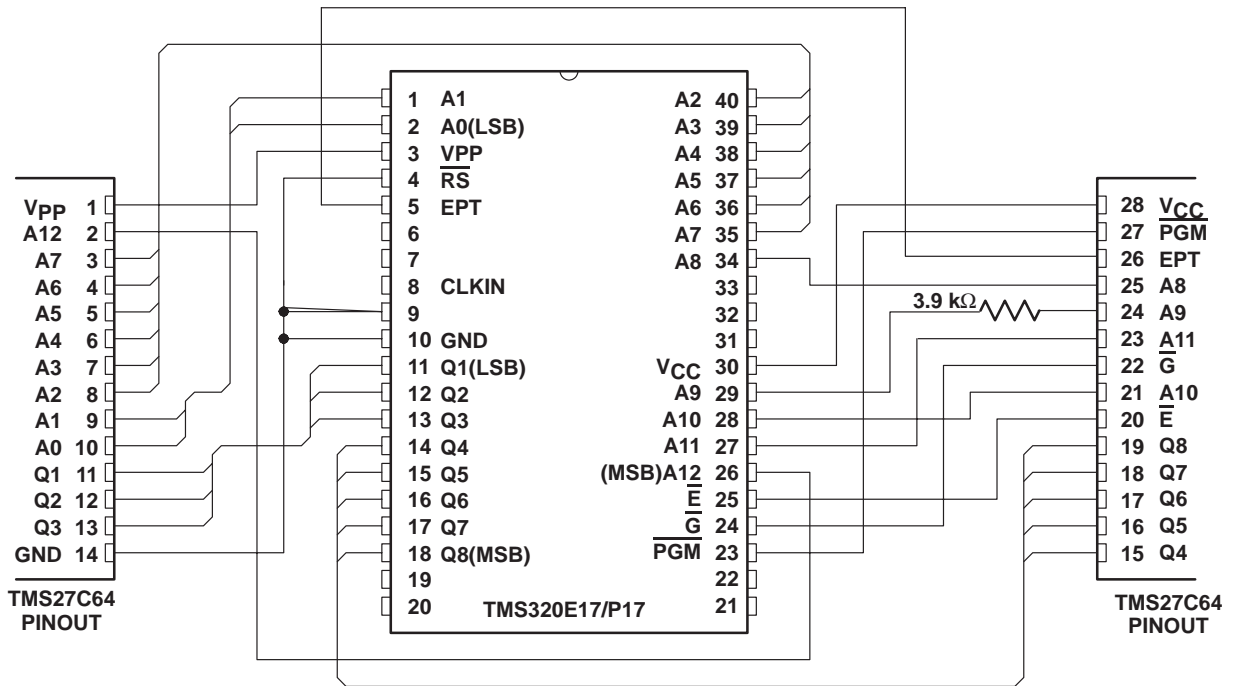

Key features of the EPROM cell include the normal programming operation as well as verification. The EPROM cell also includes a code protection feature that allows code to be protected against copyright violations.

The 'E17/P17 EPROM cell is programmed using the same family and device pinout codes as the TMS27C64 8K × 8-bit EPROM. The TMS27C64 EPROM series are ultraviolet-light erasable, electrically programmable, read-only memories, fabricated using HVC MOS technology. They are pin-compatible with existing 28-pin ROMs and EPROMs. These EPROMs operate from a single 5-V supply in the read mode; however, a 12.5-V supply is needed for programming. All programming signals are TTL level. For programming outside the system, existing EPROM programmers can be used. Locations may be programmed singly, in blocks, or at random.

Figure 20 shows the wiring conversion to program the 'E17/P17 using the 28-pin pinout of the TMS27C64. Table 8 on pin nomenclature provides a description of the TMS27C64 pins. The code to be programmed into the device should be in serial mode. The 'E17/P17 devices use 13 address lines to address 4K-word memory in byte format.

# TMS320E17, TMS320P17 DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

**CAUTION**

Although acceptable by some EPROM programmers, the signature mode cannot be used on any TMS320E1x device. The signature mode will input a high-level voltage (12.5 V<sub>dc</sub>) onto pin A9. Since this pin is not designed for high voltage, the cell will be damaged. To prevent an accidental application of voltage, Texas Instruments has inserted a 3.9 kΩ resistor between pin A9 of the TI programmer socket and the programmer itself.

### Pin Nomenclature (TMS320E17/P17)

NAME	I/O	DEFINITION
A0-A12	I	On-chip EPROM programming address lines

A5	37	5	ADDR	ADDR	ADDR	X	X
A6	36	4	ADDR	ADDR	ADDR	V <sub>IL</sub>	X
A7-A9	35, 34, 29	3, 25, 24	ADDR	ADDR	ADDR	X	X
A10-A12	28-26	21, 23, 2	ADDR	ADDR	ADDR	X	X

**Legend:**

V<sub>IH</sub> = TTL high level; V<sub>IL</sub> = TTL low level; ADDR = byte address bit  
V<sub>PP</sub> = 12.5 V ± 0.25 V; V<sub>CC</sub> = 5 V ± 0.25 V; X = don't care  
PULSE = low-going TTL level pulse; D<sub>IN</sub> = byte to be programmed at ADDR  
Q<sub>OUT</sub> = byte stored at ADDR; RBIT = ROM protect bit.

**programming**

Since every memory bit in the cell is a logic 1, the programming operation reprograms certain bits to 0. Once programmed, these bits can be erased only by using ultraviolet light. The correct byte is placed on the data bus with V<sub>PP</sub> set to the 12.5 V level. The PGM pin is then pulsed low to program in the zeroes.

**erasure**

Before programming, the device must be erased by exposing it to ultraviolet light. The recommended minimum exposure dose (UV-intensity × exposure-time) is 15 W•s/cm<sup>2</sup>. A typical 12-mW/cm<sup>2</sup>, filterless UV lamp will erase the device in 21 minutes. The lamp should be located about 2.5 cm above the chip during erasure. After exposure, all bits are in the high state.

**verify/read**

To verify correct programming, the EPROM cell can be read using either the verify or read line definitions shown in Table 8 assuming the inhibit bit has not been programmed.

**program inhibit**

Programming may be inhibited by maintaining a high level input on the  $\overline{E}$  pin or  $\overline{PGM}$  pin.

**read**

The EPROM contents may be read independent of the programming cycle, provided the RBIT (ROM protect bit) has not been programmed. The read is accomplished by setting  $\overline{E}$  to zero and pulsing  $\overline{G}$  low. The contents of the EPROM location selected by the value on the address inputs appear on Q8-Q1.

# TMS320E17, TMS320P17 DIGITAL SIGNAL PROCESSORS

SPRS009C—JANUARY 1987—REVISED JULY 1991

## output disable

During the EPROM programming process, the EPROM data outputs may be disabled, if desired, by establishing the output disable state. This state is selected by setting  $\overline{G}$  and  $\overline{E}$  pins high. While output disable is selected, Q8-Q1 are placed in the high-impedance state.

## EPROM protection

To protect the proprietary algorithms existing in the code programmed on-chip, the ability to read or verify code from external accesses can be completely disabled. Programming the RBIT disables external access of the EPROM cell, making it impossible to access the code resident in the EPROM cell. The only way to remove this protection is to erase the entire EPROM cell, thus removing the proprietary information. The signal requirements for programming this bit are shown in Table 8. The cell can be determined as protected by verifying the programming of the RBIT shown in the table.

## standard programming procedure

Before programming, the device must first be completely erased. The device can then be programmed with the correct code. It is advisable to program unused sections with zeroes as a further security measure. After the programming is complete, the code programmed into the cell should be verified. If the cell passes verification, the next step is to program the ROM protect bit (RBIT). Once the RBIT programming is verified, an opaque label should be placed over the window to protect the EPROM cell from inadvertent erasure by ambient light. At this point, the programming is complete, and the device is ready to be placed into its destination circuit.

## program cycle timing

**absolute maximum ratings over specified temperature range (unless otherwise noted)†**

Supply voltage range, $V_{CC}$ (see Note 6)	-0.3 V to 4.6 V
Input voltage range	-0.3 V to $V_{CC}$ to 0.5 V
Output voltage range	-0.3 V to $V_{CC}$ to 0.5 V
Continuous power dissipation	75 mW
Air temperature range above operating devices: L version	0°C to 70°C
A version	-40°C to 85°C
Storage temperature range	-55°C to +150°C

† Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the “Recommended Operating Conditions” section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 6: All voltage values are with respect to  $V_{SS}$ .

**recommended operating conditions**

		MIN	NOM	MAX	UNIT
$V_{CC}$	Supply voltage	3.0	3.3	3.6	V

	All others			10¶		

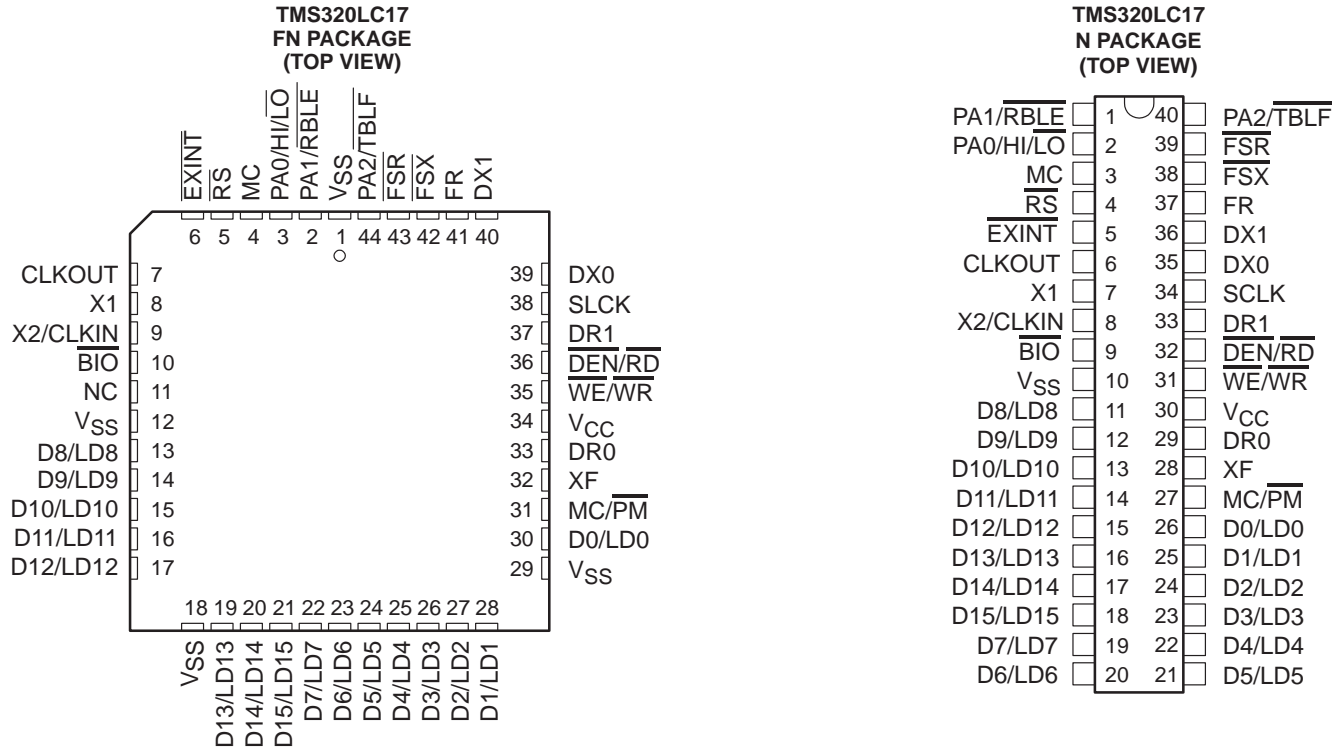

§ All typical values are at  $V_{CC} = 3.3$  V,  $T_A = 25^\circ\text{C}$ .

¶ Values derived from characterization data and not tested.

NOTE 19: This voltage specification is included for interface to HC logic. All other timing parameters defined in this data sheet are specified for the test load circuit shown in Figure 2.

# TMS320LC17 DIGITAL SIGNAL PROCESSOR

SPRS009C—JANUARY 1987—REVISED JULY 1991

## electrical characteristics over specified ranges (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP†	MAX	UNIT
$I_{CC}‡$ Supply current	$f = 14.4 \text{ MHz}$ , $V_{CC} = 3.6 \text{ V}$ , $T_A = 0^\circ\text{C to } 70^\circ\text{C}$		15	20	mA

† All typical values are at  $T_A = 70^\circ\text{C}$  and are used for thermal resistance calculations.

‡  $I_{CC}$  characteristics are inversely proportional to temperature. For  $I_{CC}$  dependence on frequency, see Figure 3.

## clock characteristics and timing

The TMS320LC17 can use either its internal oscillator or an external frequency source for a clock.

### internal clock option

The internal oscillator is enabled by connecting a crystal across X1 and X2/CLKIN (see Figure 1). The frequency of CLKOUT is one-fourth the crystal fundamental frequency. The crystal should be fundamental mode, and parallel resonant, with an effective series resistance of 30 ohms, a power dissipation of 1 mW, and be specified at a load capacitance of 20 pF.

PARAMETER	TEST CONDITIONS	MIN	NOM	MAX	UNIT
Crystal frequency $f_x$	$T_A = -40^\circ\text{C to } 85^\circ\text{C}$	4.0		14.4	MHz
C1, C2			10		pF

### external clock option

An external frequency source can be used by injecting the frequency directly into X2/CLKIN with X1 left unconnected. The external frequency injected must conform to the specifications listed in the table below.

### switching characteristics over recommended operating conditions

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
$t_{c(C)}$	CLKOUT cycle time <sup>§</sup>	$R_L = 825 \Omega$ , $C_L = 100 \text{ pF}$ , (see Figure 2)	277.78		1000	ns
$t_r(C)$	CLKOUT rise time			10 <sup>¶</sup>		ns
$t_f(C)$	CLKOUT fall time			8 <sup>¶</sup>		ns
$t_w(CL)$	Pulse duration, CLKOUT low			131		ns
$t_w(CH)$	Pulse duration, CLKOUT high			129		ns
$t_d(MCC)$	Delay time CLKIN $\uparrow$ to CLKOUT $\downarrow$			25		75

<sup>§</sup>  $t_{c(C)}$  is the cycle time of CLKOUT, i.e.,  $4t_{c(MC)}$  (4 times CLKIN cycle time if an external oscillator is used).

<sup>¶</sup> Values derived from characterization data and not tested

### timing requirements over recommended operating conditions

		MIN	NOM	MAX	UNIT
$t_{c(MC)}$	Master clock cycle time	69.5		150	ns
$t_r(MC)$	Rise time, master clock input		5 <sup>†</sup>	10 <sup>†</sup>	ns
$t_f(MC)$	Fall time, master clock input		5 <sup>†</sup>	10 <sup>†</sup>	ns
$t_w(MCP)$	Pulse duration, master clock	$0.4t_{c(MC)}$ <sup>†</sup>		$0.6t_{c(MC)}$ <sup>†</sup>	ns
$t_w(MCL)$	Pulse duration, master clock low at $t_{c(MC)}$ min		30		ns
$t_w(MCH)$	Pulse duration, master clock high at $t_{c(MC)}$ min		30		ns

<sup>†</sup> Values derived from characterization data and not tested.

## MEMORY AND PERIPHERAL INTERFACE TIMING

### switching characteristics over recommended operating conditions

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
$t_{d1}$	Delay time CLKOUT $\downarrow$ to address bus valid	$R_L = 825 \Omega$ , $C_L = 100 \text{ pF}$ , (see Figure 2)	10 <sup>†</sup>	100	ns
$t_{d4}$	Delay time CLKOUT $\downarrow$ to $\overline{DEN}\downarrow$		$1/4 t_{c(C)} - 5^{\dagger}$	$1/4 t_{c(C)} + 25$	ns
$t_{d5}$	Delay time CLKOUT $\downarrow$ to $\overline{DEN}\uparrow$		-10 <sup>†</sup>	30	ns
$t_{d6}$	Delay time CLKOUT $\downarrow$ to $\overline{WE}\downarrow$		$1/2 t_{c(C)} - 5^{\dagger}$	$1/2 t_{c(C)} + 25$	ns
$t_{d7}$	Delay time CLKOUT $\downarrow$ to $\overline{WE}\uparrow$		-10 <sup>†</sup>	30	ns
$t_{d8}$	Delay time CLKOUT $\downarrow$ to data bus OUT valid			$1/4 t_{c(C)} + 130$	ns
$t_{d9}$	Time after CLKOUT $\downarrow$ that data bus starts to be driven			$1/4 t_{c(C)} - 5^{\dagger}$	ns
$t_{d10}$	Time after CLKOUT $\downarrow$ that data bus stops being driven			$1/4 t_{c(C)} + 90$	ns
$t_v$	Data bus OUT valid after CLKOUT $\downarrow$			$1/4 t_{c(C)} - 10$	ns
$t_h(A-WMD)$	Address hold time after $\overline{WE}\uparrow$ , $\overline{MEN}\uparrow$ , or $\overline{DEN}\uparrow$ (see Note 14)			0 <sup>†</sup>	ns
$t_{su}(A-MD)$	Address bus setup time or $\overline{DEN}\downarrow$			0	ns

<sup>†</sup> Values derived from characterization data and not tested.

NOTE 14: Address bus will be valid upon  $\overline{WE}\uparrow$ ,  $\overline{MEN}\uparrow$ , or  $\overline{DEN}\uparrow$ .

# TMS320LC17

## DIGITAL SIGNAL PROCESSOR

SPRS009C—JANUARY 1987—REVISED JULY 1991

### timing requirements over recommended operating conditions

		TEST CONDITIONS	MIN	NOM	MAX	UNIT
$t_{su(D)}$	Setup time data bus valid prior to CLKOUT↓	$R_L = 825 \Omega$ , $C_L = 100 \text{ pF}$ , (see Figure 2)	80			ns
$t_{h(D)}$	Hold time data bus held valid after CLKOUT↓ (see Note 9)		0			ns

NOTE 9: Data may be removed from the data bus upon  $\overline{MEN}\uparrow$  or  $\overline{DEN}\uparrow$  preceding CLKOUT↓.

### RESET ( $\overline{RS}$ ) TIMING

#### switching characteristics over recommended operating conditions

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
$t_{d11}$	Delay time $\overline{DEN}\uparrow$ , $\overline{WE}\uparrow$ , and $\overline{MEN}\uparrow$ from $\overline{RS}$	$R_L = 825 \Omega$ , $C_L = 100 \text{ pF}$ , (see Figure 2)			$1/2t_{c(C)}+75$	ns
$t_{dis(R)}$	Data bus disable time after $\overline{RS}$				$1/4t_{c(C)}+75$	ns
$t_{d12}$	Delay time from $\overline{RS}\downarrow$ to high-impedance SCLK				200†	ns
$t_{d13}$	Delay time from $\overline{RS}\downarrow$ to high-impedance DX1, DX0				200†	ns

† These values were derived from characterization data and not tested.

#### timing requirements over recommended operating conditions

		MIN	NOM	MAX	UNIT
$t_{su(R)}$	Reset ( $\overline{RS}$ ) setup time prior to CLKOUT (see Note 10)	85			ns
$t_{w(R)}$	$\overline{RS}$ pulse duration	$5t_{c(C)}$			ns

NOTE 10:  $\overline{RS}$  can occur anytime during a clock cycle. Time given is minimum to ensure synchronous operation.

### INTERRUPT ( $\overline{EXINT}$ ) TIMING

#### timing requirements over recommended operating conditions

		MIN	NOM	MAX	UNIT
$t_f(\text{INT})$	Fall time $\overline{EXINT}$			15	ns
$t_w(\text{INT})$	Pulse duration $\overline{EXINT}$	$t_{c(C)}$			ns
$t_{su}(\text{INT})$	Setup time $\overline{EXINT}\downarrow$ before CLKOUT↓	85			ns

### I/O ( $\overline{BIO}$ ) TIMING

#### timing requirements over recommended operating conditions

		MIN	NOM	MAX	UNIT
$t_f(\text{IO})$	Fall time $\overline{BIO}$			15	ns
$t_w(\text{IO})$	Pulse duration $\overline{BIO}$	$t_{c(C)}$			ns
$t_{su}(\text{IO})$	Setup time $\overline{BIO}\downarrow$ before CLKOUT↓	85			ns

## I/O ( $\overline{\text{BIO}}$ ) TIMING

### switching characteristics over recommended operating conditions

PARAMETER	TEST CONDITIONS	MIN	NOM	MAX	UNIT
$t_d(\text{XF})$ Delay time CLKOUT $\downarrow$ to valid XF	$R_L = 825 \Omega$ , $C_L = 100 \text{ pF}$ , (see Figure 2)	5 $\dagger$		115	ns

$\dagger$  Values derived from characterization data and not tested.

## SERIAL PORT TIMING

### switching characteristics over recommended operating conditions

	MIN	NOM	MAX	UNIT
$t_d(\text{CH-FR})$ Internal framing (FR) delay from SCLK rising edge			120	ns
$t_d(\text{DX1-CL})$ DX bit 1 valid before SCLK falling edge	20			ns
$t_d(\text{DX2-CL})$ DX bit 2 valid before SCLK falling edge	20			ns
$t_h(\text{DX})$ DX hold time after SCLK falling edge	$t_c(\text{SCLK})/2$			ns

### timing requirements over recommended operating conditions

	MIN	NOM	MAX	UNIT
$t_c(\text{SCLK})$ Serial port clock (SCLK) cycle time $\dagger$	555		8000	ns
$t_f(\text{SCLK})$ Serial port clock (SCLK) fall time			30 $\dagger$	ns
$t_r(\text{SCLK})$ Serial port clock (SCLK) rise time			30 $\dagger$	ns
$t_w(\text{SCLK})$ Serial port clock (SCLK) low, pulse duration $\S$	250		4400	ns
$t_w(\text{SCLKH})$ Serial port clock (SCLK) high, pulse duration $\S$	250		4400	ns
$t_{su}(\text{FS})$ $\overline{\text{FSX}}/\overline{\text{FSR}}$ setup time before SCLK falling edge	130			ns
$t_{su}(\text{DR})$ DR setup time before SCLK falling edge	20			ns
$t_h(\text{DR})$ DR hold time after SCLK falling edge	20			ns

$\dagger$  Values derived from characterization data and not tested.

$\ddagger$  Minimum cycle time is  $2t_c(\text{C})$  where  $t_c(\text{C})$  is CLKOUT cycle time.

$\S$  The duty cycle of the serial port clock must be within 45 to 55%.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMS320C10FNL25	OBSOLETE	PLCC	FN	44		TBD	Call TI	Call TI	0 to 70	-25 @1987 TI TMS320C10FNL	

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

24 PIN SHOWN

4040053/B 04/95

- NOTES: A. All linear dimensions are in inches (millimeters).  
 B. This drawing is subject to change without notice.  
 C. Falls within JEDEC MS-011  
 D. Falls within JEDEC MS-015 (32 pin only)

PE (S-PQFP-G44)

PLASTIC QUAD FLATPACK

- NOTES: A. All linear dimensions are in millimeters.  
 B. This drawing is subject to change without notice.  
 C. Contact field sales office to determine if a tighter coplanarity requirement is available for this package.

# PACKAGE OUTLINE

## FN0044A

### PLCC - 4.57 mm max height

PLASTIC CHIP CARRIER

4215154/A 04/2017

#### NOTES:

1. All linear dimensions are in inches. Any dimensions in brackets are in millimeters. Any dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Dimension does not include mold protrusion. Maximum allowable mold protrusion .01 in [0.25 mm] per side.
4. Reference JEDEC registration MS-018.

# EXAMPLE BOARD LAYOUT

FN0044A

PLCC - 4.57 mm max height

PLASTIC CHIP CARRIER

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:4X

SOLDER MASK DETAILS

4215154/A 04/2017

NOTES: (continued)

- 5. Publication IPC-7351 may have alternate designs.
- 6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

FN0044A

PLCC - 4.57 mm max height

PLASTIC CHIP CARRIER

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:4X

4215154/A 04/2017

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
