

1 TMS320DM6435 Digital Media Processor

1.1 Features

- **High-Performance Digital Media Processor (DM6435)**
 - 2.5-, 2-, 1.67-, 1.51-, 1.43-ns ns Instruction Cycle Time
 - 400-, 500-, 600-, 660-, 700-MHz C64x+™ Clock Rate
 - Eight 32-Bit C64x+ Instructions/Cycle
 - 3200, 4000, 4800, 5280, 5600 MIPS
 - Fully Software-Compatible With C64x
 - Commercial and Automotive (Q or S suffix) Grades
 - Low Power Device (L suffix)
- **VelociTI.2™ Extensions to VelociTI™ Advanced Very-Long-Instruction-Word (VLIW) TMS320C64x+™ DSP Core**
 - Eight Highly Independent Functional Units With VelociTI.2 Extensions:
 - Six ALUs (32-/40-Bit), Each Supports Single 32-Bit, Dual 16-Bit, or Quad 8-Bit Arithmetic per Clock Cycle
 - Two Multipliers Support Four 16 x 16-Bit Multiplies (32-Bit Results) per Clock Cycle or Eight 8 x 8-Bit Multiplies (16-Bit Results) per Clock Cycle
 - Load-Store Architecture With Non-Aligned Support
 - 64 32-Bit General-Purpose Registers
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
 - Additional C64x+™ Enhancements
 - Protected Mode Operation
 - Exceptions Support for Error Detection and Program Redirection
 - Hardware Support for Modulo Loop Auto-Focus Module Operation
- **C64x+ Instruction Set Features**
 - Byte-Addressable (8-/16-/32-/64-Bit Data)
 - 8-Bit Overflow Protection
 - Bit-Field Extract, Set, Clear
 - Normalization, Saturation, Bit-Counting
 - VelociTI.2 Increased Orthogonality
 - C64x+ Extensions
 - Compact 16-bit Instructions
 - Additional Instructions to Support Complex Multiplies
- **C64x+ L1/L2 Memory Architecture**
 - 256K-Bit (32K-Byte) L1P Program RAM/Cache [Flexible Allocation]
 - 640K-Bit (80K-Byte) L1D Data RAM/Cache [Flexible Allocation]
 - 1M-Bit (128K-Byte) L2 Unified Mapped RAM/Cache [Flexible Allocation]
- **Supports Little Endian Mode Only**
- **Video Processing Subsystem (VPSS), VPFE Only**
 - Front End Provides:
 - CCD and CMOS Imager Interface
 - BT.601/BT.656 Digital YCbCr 4:2:2 (8-/16-Bit) Interface
 - Preview Engine for Real-Time Image Processing
 - Glueless Interface to Common Video Decoders
 - Histogram Module
 - Auto-Exposure, Auto-White Balance and Auto-Focus Module
 - Resize Engine
 - Resize Images From 1/4x to 4x
 - Separate Horizontal/Vertical Control
- **External Memory Interfaces (EMIFs)**
 - 32-Bit DDR2 SDRAM Memory Controller With 256M-Byte Address Space (1.8-V I/O)
 - Supports up to 333-MHz (data rate) bus and interfaces to DDR2-400 SDRAM
 - Asynchronous 8-Bit Wide EMIF (EMIFA) With up to 64M-Byte Address Reach
 - Flash Memory Interfaces
 - NOR (8-Bit-Wide Data)
 - NAND (8-Bit-Wide Data)
- **Enhanced Direct-Memory-Access (EDMA) Controller (64 Independent Channels)**
- **Two 64-Bit General-Purpose Timers (Each Configurable as Two 32-Bit Timers)**
- **One 64-Bit Watch Dog Timer**
- **Two UARTs (One with RTS and CTS Flow Control)**
- **Master/Slave Inter-Integrated Circuit (I²C Bus™)**
- **Multichannel Buffered Serial Port (McBSP)**
 - I2S and TDM
 - AC97 Audio Codec Interface

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this document.

All trademarks are the property of their respective owners.

- SPI
- Standard Voice Codec Interface (AIC12)
- Telecom Interfaces – ST-Bus, H-100
- 128 Channel Mode
- Multichannel Audio Serial Port (McASP0)
 - Four Serializers and SPDIF (DIT) Mode
- 16-Bit Host-Port Interface (HPI)
- High-End CAN Controller (HECC)
- 10/100 Mb/s Ethernet MAC (EMAC)
 - IEEE 802.3 Compliant
 - Supports Media Independent Interface (MII)
 - Management Data I/O (MDIO) Module
- VLYNQ™ Interface (FPGA Interface)
- Three Pulse Width Modulator (PWM) Outputs
- On-Chip ROM Bootloader
- Individual Power-Savings Modes
- Flexible PLL Clock Generators
- IEEE-1149.1 (JTAG™) Boundary-Scan-Compatible
- Up to 111 General-Purpose I/O (GPIO) Pins (Multiplexed With Other Device Functions)
- Packages:
 - 361-Pin Pb-Free PBGA Package (ZWT Suffix), 0.8-mm Ball Pitch
 - 376-Pin Plastic BGA Package (ZDU Suffix), 1.0-mm Ball Pitch
- 0.09- μ m/6-Level Cu Metal Process (CMOS)
- 3.3-V and 1.8-V I/O, 1.2-V Internal (-7/-6/-5/-4/-L/-Q6/-Q5/-Q4)
- 3.3-V and 1.8-V I/O, 1.05-V Internal (-7/-6/-5/-4/-L/-Q5)
- Applications:
 - Digital Media
 - Networked Media Encode
 - Video Imaging

1.2 Description

The TMS320C64x+™ DSPs (including the TMS320DM6435 device) are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The DM6435 device is based on the third-generation high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for digital media applications. The C64x+™ devices are upward code-compatible from previous devices that are part of the C6000™ DSP platform. The C64x™ DSPs support added functionality and have an expanded instruction set from previous devices.

Any reference to the C64x DSP or C64x CPU also applies, unless otherwise noted, to the C64x+ DSP and C64x+ CPU, respectively.

With performance of up to 5600 million instructions per second (MIPS) at a clock rate of 700 MHz, the C64x+ core offers solutions to high-performance DSP programming challenges. The DSP core possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. The C64x+ DSP core processor has 64 general-purpose registers of 32-bit word length and eight highly independent functional units—two multipliers for a 32-bit result and six arithmetic logic units (ALUs). The eight functional units include instructions to accelerate the performance in video and imaging applications. The DSP core can produce four 16-bit multiply-accumulates (MACs) per cycle for a total of 2800 million MACs per second (MMACS), or eight 8-bit MACs per cycle for a total of 5600 MMACS. For more details on the C64x+ DSP, see the *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (literature number [SPRU732](#)).

The DM6435 also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals similar to the other C6000 DSP platform devices. The DM6435 core uses a two-level cache-based architecture. The Level 1 program memory/cache (L1P) consists of a 256K-bit memory space that can be configured as mapped memory or direct mapped cache, and the Level 1 data (L1D) consists of a 640K-bit memory space—384K-bit of which is mapped memory and 256K-bit of which can be configured as mapped memory or 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 1M-bit memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or combinations of the two.

The peripheral set includes: a configurable video port (VPFE); a 10/100 Mb/s Ethernet MAC (EMAC) with a management data input/output (MDIO) module; a 4-bit transmit, 4-bit receive VLYNQ interface; an inter-integrated circuit (I2C) Bus interface; a multichannel buffered serial port (McBSP); a multichannel audio serial port (McASP0) with 4 serializers; 2 64-bit general-purpose timers each configurable as 2 independent 32-bit timers; 1 64-bit watchdog timer; a user-configurable 16-bit host-port interface (HPI); up to 111-pins of general-purpose input/output (GPIO) with programmable interrupt/event generation modes, multiplexed with other peripherals; 2 UARTs with hardware handshaking support on 1 UART; 3 pulse width modulator (PWM) peripherals; 1 high-end controller area network (CAN) controller [HECC]; and 2 glueless external memory interfaces: an asynchronous external memory interface (EMIFA) for slower memories/peripherals, and a higher speed synchronous memory interface for DDR2.

The DM6435 device includes a Video Processing Subsystem (VPSS) with a configurable video/imaging front-end input peripheral used for video capture.

The Video Processing Front-End (VPFE) is comprised of a CCD Controller (CCDC), a Preview Engine (Previewer), Histogram Module, Auto-Exposure/White Balance/Focus Module (H3A), and Resizer. The CCDC is capable of interfacing to common video decoders, CMOS sensors, and Charge Coupled Devices (CCDs). The Previewer is a real-time image processing engine that takes raw imager data from a CMOS sensor or CCD and converts from an RGB Bayer Pattern to YUV422. The Histogram and H3A modules provide statistical information on the raw color data for use by the DM6435. The Resizer accepts image data for separate horizontal and vertical resizing from 1/4x to 4x in increments of 256/N, where N is between 64 and 1024.

The Ethernet Media Access Controller (EMAC) provides an efficient interface between the DM6435 and the network. The DM6435 EMAC support both 10Base-T and 100Base-TX, or 10 Mbits/second (Mbps) and 100 Mbps in either half- or full-duplex mode, with hardware flow control and quality of service (QOS) support.

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The I2C and VLYNQ ports allow DM6435 to easily control peripheral devices and/or communicate with host processors.

The high-end controller area network (CAN) controller [HECC] module provides a network protocol in a harsh environment to communicate serially with other controllers, typically in automotive applications.

The rich peripheral set provides the ability to control external peripheral devices and communicate with external processors. For details on each of the peripherals, see the related sections later in this document and the associated peripheral reference guides.

The DM6435 has a complete set of development tools. These include C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

This data manual revision history highlights the technical changes made to the SPRS344B device-specific data manual to make it an SPRS344C revision.

This data manual revision history highlights the technical changes made to the SPRS344B device-specific data manual to make it an SPRS344C revision.

Scope: Applicable updates to the TMS320DM643x DMP, specifically relating to the TMS320DM6435 device, have been incorporated.

- Added 660- and 700-MHz C64x+™ device speeds.
- Added designators for low-power (-L) devices.

(3) PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

2.2 CPU (DSP Core) Description

The C64x+ Central Processing Unit (CPU) consists of eight functional units, two register files, and two data paths as shown in [Figure 2-1](#). The two general-purpose register files (A and B) each contain 32 32-bit registers for a total of 64 registers. The general-purpose registers can be used for data or can be data address pointers. The data types supported include packed 8-bit data, packed 16-bit data, 32-bit data, 40-bit data, and 64-bit data. Values larger than 32 bits, such as 40-bit-long or 64-bit-long values are stored in register pairs, with the 32 LSBs of data placed in an even register and the remaining 8 or 32 MSBs in the next upper register (which is always an odd-numbered register).

The eight functional units (.M1, .L1, .D1, .S1, .M2, .L2, .D2, and .S2) are each capable of executing one instruction every clock cycle. The .M functional units perform all multiply operations. The .S and .L units perform a general set of arithmetic, logical, and branch functions. The .D units primarily load data from memory to the register file and store results from the register file into memory.

The C64x+ CPU extends the performance of the C64x core through enhancements and new features.

Each C64x+ .M unit can perform one of the following each clock cycle: one 32 x 32 bit multiply, one 16 x 32 bit multiply, two 16 x 16 bit multiplies, two 16 x 32 bit multiplies, two 16 x 16 bit multiplies with add/subtract capabilities, four 8 x 8 bit multiplies, four 8 x 8 bit multiplies with add operations, and four 16 x 16 multiplies with add/subtract capabilities (including a complex multiply). There is also support for Galois field multiplication for 8-bit and 32-bit data. Many communications algorithms such as FFTs and modems require complex multiplication. The complex multiply (CMPY) instruction takes for 16-bit inputs and produces a 32-bit real and a 32-bit imaginary output. There are also complex multiplies with rounding capability that produces one 32-bit packed output that contain 16-bit real and 16-bit imaginary values. The 32 x 32 bit multiply instructions provide the extended precision necessary for audio and other high-precision algorithms on a variety of signed and unsigned 32-bit data types.

The .L or (Arithmetic Logic Unit) now incorporates the ability to do parallel add/subtract operations on a pair of common inputs. Versions of this instruction exist to work on 32-bit data or on pairs of 16-bit data performing dual 16-bit add and subtracts in parallel. There are also saturated forms of these instructions.

The C64x+ core enhances the .S unit in several ways. In the C64x core, dual 16-bit MIN2 and MAX2 comparisons were only available on the .L units. On the C64x+ core they are also available on the .S unit which increases the performance of algorithms that do searching and sorting. Finally, to increase data packing and unpacking throughput, the .S unit allows sustained high performance for the quad 8-bit/16-bit and dual 16-bit instructions. Unpack instructions prepare 8-bit data for parallel 16-bit operations. Pack instructions return parallel results to output precision including saturation support.

Other new features include:

- **SPLOOP** - A small instruction buffer in the CPU that aids in creation of software pipelining loops where multiple iterations of a loop are executed in parallel. The SPLOOP buffer reduces the code size associated with software pipelining. Furthermore, loops in the SPLOOP buffer are fully interruptible.
- **Compact Instructions** - The native instruction size for the C6000 devices is 32 bits. Many common instructions such as MPY, AND, OR, ADD, and SUB can be expressed as 16 bits if the C64x+ compiler can restrict the code to use certain registers in the register file. This compression is performed by the code generation tools.
- **Instruction Set Enhancement** - As noted above, there are new instructions such as 32-bit multiplications, complex multiplications, packing, sorting, bit manipulation, and 32-bit Galois field multiplication.
- **Exceptions Handling** - Intended to aid the programmer in isolating bugs. The C64x+ CPU is able to detect and respond to exceptions, both from internally detected sources (such as illegal op-codes) and from system events (such as a watchdog time expiration).
- **Privilege** - Defines user and supervisor modes of operation, allowing the operating system to give a basic level of protection to sensitive resources. Local memory is divided into multiple pages, each with read, write, and execute permissions.
- **Time-Stamp Counter** - Primarily targeted for Real-Time Operating System (RTOS) robustness, a free-running time-stamp counter is implemented in the CPU which is *not* sensitive to system stalls.

For more details on the C64x+ CPU and its enhancements over the C64x architecture, see the following documents:

- *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (literature number [SPRU732](#))
- *TMS320C64x+ DSP Megamodule Reference Guide* (literature number [SPRU871](#))
- *TMS320C64x to TMS320C64x+ CPU Migration Guide* Application Report (literature number [SPRAA84](#))
- *TMS320C64x+ DSP Cache User's Guide* (literature number [SPRU862](#))

Figure 2-1. TMS320C64x+™ CPU (DSP Core) Data Paths

2.3 C64x+ CPU

The C64x+ core uses a two-level cache-based architecture. The Level 1 Program memory/cache (L1P) consists of 32 KB memory space that can be configured as mapped memory or direct mapped cache. The Level 1 Data memory/cache (L1D) consists of 80 KB—48 KB of which is mapped memory and 32 KB of which can be configured as mapped memory or 2-way set associated cache. The Level 2 memory/cache (L2) consists of a 128 KB memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or a combination of both.

Table 2-2 shows a memory map of the C64x+ CPU cache registers for the device.

Table 2-2. C64x+ Cache Registers

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION
0x0184 0000	L2CFG	L2 Cache configuration register

2.4 Memory Map Summary

Table 2-3 shows the memory map address ranges of the device. Table 2-4 depicts the expanded map of the Configuration Space (0x0180 0000 through 0x0FFF FFFF). The device has multiple on-chip memories associated with its two processors and various subsystems. To help simplify software development a unified memory map is used where possible to maintain a consistent view of device resources across all bus masters.

Table 2-3. Memory Map Summary

- (1) For all bootmodes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM (L2CFG.L2MODE = 0h, L1PCFG.L1PMODE = 0h, and L1DCFG.L1DMODE = 0h). If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see [Section 3.4.1, Boot Modes](#). For more information on the bootloader, see the *Using the TMS320DM643x Bootloader Application Report* (literature number [SPRAAG0](#)). For the EMIFA ROM Direct Boot (BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader is not executed—that is, L2 RAM/Cache defaults to all RAM (L2CFG.L2MODE = 0h); L1P RAM/Cache defaults to all cache (L1PCFG.L1PMODE = 7h); and L1D RAM/Cache defaults to all cache (L1DCFG.L1DMODE = 7h).
- (2) The EMIFA CS0 and CS1 are **not** functionally supported on the DM6435 device, and therefore, are **not** pinned out.

2.5 Pin Assignments

Extensive use of pin multiplexing is used to accommodate the largest number of peripheral functions in the smallest possible package. Pin multiplexing is controlled using a combination of hardware configuration at device reset and software programmable register settings. For more information on pin muxing, see [Section 3.7, Multiplexed Pin Configurations](#) of this document.

2.5.1 Pin Map (Bottom View)

Figure 2-2 through Figure 2-5 show the bottom view of the **ZWT** package pin assignments in four quadrants (A, B, C, and D). Figure 2-6 through Figure 2-9 show the bottom view of the **ZDU** package pin assignments in four quadrants (A, B, C, and D).

2.6 Terminal Functions

The terminal functions tables (Table 2-5 through Table 2-28) identify the external signal names, the associated pin (ball) numbers along with the mechanical package designator, the pin type, whether the pin has any internal pullup or pulldown resistors, and a functional pin description. For more detailed information on device configuration, peripheral selection, multiplexed/shared pin, and debugging considerations, see the Device Configurations section of this data manual.

All device boot and configuration pins are multiplexed configuration pins— meaning they are multiplexed with functional pins. These pins function as device boot and configuration pins only during device reset. The input states of these pins are sampled and latched into the BOOTCFG register when device reset is deasserted (see **Note** below). After device reset is deasserted, the values on these multiplexed pins no longer have to hold the configuration.

For proper device operation, external pullup/pulldown resistors may be required on these device boot and configuration pins. Section 3.9.1, *Pullup/Pulldown Resistors* discusses situations where external pullup/pulldown resistors are required.

Note: Internal to the chip, the two device reset pins $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ are logically AND'd together for the purpose of latching device boot and configuration pins. The values on all device boot and configuration pins are latched into the BOOTCFG register when the logical AND of $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ transitions from low-to-high.

Table 2-5. BOOT Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
BOOT					
GP[25]/ (BOOTMODE3)	G16	H21	I/O/Z	IPD DV _{DD33}	Bootmode configuration bits. These bootmode functions along with the FASTBOOT function determine what device bootmode configuration is selected. The DM6435 device supports several types of bootmodes along with a FASTBOOT option; for more details on the types/options, see Section 3.4.1, <i>Boot Modes</i> .
GP[24]/ (BOOTMODE2)	G15	L20			
GP[23]/ (BOOTMODE1)	F15	K20			
GP[22]/ (BOOTMODE0)	F18	J20			
GP[26]/ (FASTBOOT)	G17	K19	I/O/Z	IPD DV _{DD33}	Fast Boot 0 = Not Fast Boot 1 = Fast Boot
EM_A[4]/GP[10]/ (AEAW2/PLLMS2)	A17	B21	I/O/Z	IPD DV _{DD33}	EMIFA Address Bus Width (AEAW) and Fast Boot PLL Multiplier Select (PLLMS).
EM_A[1]/(ALE)/ GP[9]/(AEAW1/PLLMS1)	A16	B20	I/O/Z	IPD DV _{DD33}	These configuration pins serve two purposes which are based on AEM[2:0] settings. For AEM[2:0] = 001 [8-bit EMIFA (Async) Pinout Mode 1], the AEA/W/PLLMS pins serve as the AEA/W function to select EMIFA Address Bus Width.
EM_A[2]/(CLE)/ GP[8]/(AEAW0/PLLMS0)	B16	A20	I/O/Z	IPD DV _{DD33}	For all other AEM modes, the AEA/W/PLLMS pins select the PLL multiplier for fast boot. For more details, see Section 3.5.1.2, <i>EMIFA Address Width Select (AEAW) and Fast Boot PLL Multiplier Select (PLLMS)</i> .

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
- (3) Specifies the operating I/O supply voltage for each signal

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
EM_A[0]/GP[7]/ (AEM2)	B17	C21	I/O/Z	IPD DV _{DD33}	Selects EMIFA Pinout Mode The DM6435 supports the following EMIFA Pinout Modes: AEM[2:0] = 000, No EMIFA AEM[2:0] = 001, 8-bit EMIFA (Async) Pinout Mode 1 AEM[2:0] = 101, 8-bit EMIFA (NAND) Pinout Mode 5 This signal doesn't actually affect the EMIFA module. It only affects how the EMIFA is pinned out.
EM_BA[0]/GP[6]/ (AEM1)	C17	E20	I/O/Z	IPD DV _{DD33}	
EM_BA[1]/GP[5]/ (AEM0)	C16	C20	I/O/Z	IPD DV _{DD33}	
GP[28]	H16	J21	I/O/Z	IPD DV _{DD33}	For proper DM6435 device operation, if this pin is both routed and 3-stated (not driven) during device reset, it must be pulled down via an external resistor. For more detailed information on pullup/pulldown resistors, see Section 3.9.1, Pullup/Pulldown Resistors .
GP[27]	H17	L19	I/O/Z	IPU DV _{DD33}	For proper DM6435 device operation, if this pin is both routed and 3-stated (not driven) during device reset, it must be pulled up via an external resistor. For more detailed information on pullup/pulldown resistors, see Section 3.9.1, Pullup/Pulldown Resistors .

Table 2-6. Oscillator/PLL Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
OSCILLATOR, PLL					
MXI/CLKIN	K19	N22	I	MXV _{DD}	Crystal input MXI for MX oscillator (system oscillator, typically 27 MHz). If the internal oscillator is bypassed, this is the external oscillator clock input. ⁽³⁾
MXO	J19	M22	O	MXV _{DD}	Crystal output for MX oscillator
MXV _{DD}	L18	N21	S	(4)	1.8 V power supply for MX oscillator. On the board, this pin can be connected to the same 1.8 V power supply as DV _{DDR2} .
MXV _{SS}	K18	M21	GND	(4)	Ground for MX oscillator
PLL _{PWR18}	L16	N20	S	(4)	1.8 V power supply for PLLs

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) Specifies the operating I/O supply voltage for each signal
- (3) For more information on external board connections, see [Section 6.6, External Clock Input From MXI/CLKIN Pin](#).
- (4) For more information, see the *Recommended Operating Conditions* table

Table 2-7. Clock Generator Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
CLOCK GENERATOR					
CLKOUT0/ PWM2/GP[84]	M1	R1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the System Clock generator (PLL1), PWM2, and GPIO. For the System Clock generator (PLL1), it is clock output CLKOUT0. This is configurable for 27 MHz or other 27 MHz-divided-down (/1 to /32) clock outputs.

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-8. RESET and JTAG Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
RESET					
$\overline{\text{RESET}}$	M4	R3	I	IPU DV _{DD33}	Device reset
$\overline{\text{RESETOUT}}$	N3	T3	O/Z	– DV _{DD33}	Reset output status pin. The $\overline{\text{RESETOUT}}$ pin indicates when the device is in reset.
$\overline{\text{POR}}$	N4	R2	I	IPU DV _{DD33}	Power-on reset.
JTAG					
TMS	R3	V3	I	IPU DV _{DD33}	JTAG test-port mode select input. For proper device operation, do not oppose the IPU on this pin.
TDO	P3	U2	O/Z	– DV _{DD33}	JTAG test-port data output
TDI	P4	U3	I	IPU DV _{DD33}	JTAG test-port data input
TCK	N1	U1	I	IPU DV _{DD33}	JTAG test-port clock input
$\overline{\text{TRST}}$	R2	V2	I	IPD DV _{DD33}	JTAG test-port reset. For IEEE 1149.1 JTAG compatibility, see the IEEE 1149.1 JTAG compatibility statement portion of this data sheet
EMU1	N2	T2	I/O/Z	IPU DV _{DD33}	Emulation pin 1
EMU0	P2	T1	I/O/Z	IPU DV _{DD33}	Emulation pin 0

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-9. EMIFA Terminal Functions (Boot Configuration)

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
EMIFA: BOOT CONFIGURATION					
EM_A[4]/GP[10]/ (AEAW2/PLLMS2)	A17	B21	I/O/Z	IPD DV _{DD33}	These pins are multiplexed between the EMIFA and GPIO. When RESET or POR is asserted, these pins function as EMIFA configuration pins. At reset if AEM[2:0] = 001 (EMIFA in 8-bit Async mode), then the input states of AEAW[2:0] are sampled to set the EMIFA Address Bus Width. After reset, these pins function as EMIFA or GPIO pin functions based on pin mux selection. For more details on the AEAW/PLLMS functions, see Section 3.5.1.2, EMIFA Address Width Select (AEAW) and Fast Boot PLL Multiplier Select (PLLMS) .
EM_A[1]/(ALE)/GP[9]/ (AEAW1/PLLMS1)	A16	B20	I/O/Z	IPD DV _{DD33}	
EM_A[2]/(CLE)/GP[8]/ (AEAW0/PLLMS0)	B16	A20	I/O/Z	IPD DV _{DD33}	These pins are multiplexed between the EMIFA and GPIO. When RESET or POR is asserted, these pins function as EMIFA configuration pins. At reset, the input states of AEM[2:0] are sampled to set the EMIFA Pinout Mode. For more details, see Section 3.5.1, Configurations at Reset . After reset, these pins function as EMIFA or GPIO pin functions based on pin mux selection. For more details on the AEM functions, see Section 3.5.1.1, EMIFA Pinout Mode (AEM[2:0]) .
EM_BA[1]/GP[5]/ (AEM0)	C16	C20	I/O/Z	IPD DV _{DD33}	
EM_BA[0]/GP[6]/ (AEM1)	C17	E20	I/O/Z	IPD DV _{DD33}	
EM_A[0]/GP[7]/ (AEM2)	B17	C21	I/O/Z	IPD DV _{DD33}	

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-10. EMIFA Terminal Functions (EMIFA Pinout Mode 1, AEM[2:0] = 001)

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
EMIFA FUNCTIONAL PINS: 8-Bit ASYNC/NOR (EMIFA Pinout Mode 1, AEM[2:0] = 001)					
Actual pin functions are determined by the PINMUX0 and PINMUX1 register bit settings (e.g., AEAWE[2:0], AEM[2:0], etc.). For more details, see Section 3.7, Multiplexed Pin Configurations .					
$\overline{\text{EM_CS2}}$ / GP[12]	C19	C22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is Chip Select 2 output $\overline{\text{EM_CS2}}$ for use with asynchronous memories (i.e., NOR flash). This is the chip select for the default boot and ROM boot modes. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
$\overline{\text{EM_CS3}}$ / GP[13]	C18	D22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, this pin is Chip Select 3 output $\overline{\text{EM_CS3}}$ for use with asynchronous memories (i.e., NOR flash). Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
$\overline{\text{EM_CS4}}$ / GP[32]	E19	H22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, it is Chip Select 4 output $\overline{\text{EM_CS4}}$ for use with asynchronous memories (i.e., NOR flash). Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
$\overline{\text{EM_CS5}}$ / GP[33]	F19	J22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, it is Chip Select 5 output $\overline{\text{EM_CS5}}$ for use with asynchronous memories (i.e., NOR flash). Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
C _{WE} /EM _R $\overline{\text{W}}$ / GP[35]	D13	C17	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between VPFE (CCDC), EMIFA, and GPIO. For EMIFA, it is read/write output EM _R $\overline{\text{W}}$.
EM_WAIT/ (RDY/BSY)	E15	D20	I/O/Z	IPU DV _{DD33}	For EMIFA (ASYNC/NOR), this pin is wait state extension input EM_WAIT.
$\overline{\text{EM_OE}}$	D15	D19	I/O/Z	IPU DV _{DD33}	For EMIFA, it is output enable output $\overline{\text{EM_OE}}$.
$\overline{\text{EM_WE}}$	E14	C19	I/O/Z	IPU DV _{DD33}	For EMIFA, it is write enable output $\overline{\text{EM_WE}}$.
EM_BA[0]/GP[6]/ (AEM1)	C17	E20	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, this is the Bank Address 0 output (EM_BA[0]). When connected to an 8-bit asynchronous memory, this pin is the lowest order bit of the byte address.
EM_BA[1]/GP[5]/ (AEM0)	C16	C20	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, this is the Bank Address 1 output EM_BA[1]. When connected to an 8-bit asynchronous memory, this pin is the 2nd bit of the address.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

For EMIFA, this pin is Chip Select 2 output $\overline{\text{EM_CS2}}$ for use with NAND flash. This is the chip select for the default boot and ROM boot modes. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
$\overline{\text{EM_CS3}}$ /GP[13]	C18	D22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA (NAND) and GPIO. For EMIFA, this pin is Chip Select 3 output $\overline{\text{EM_CS3}}$ for use with NAND flash. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
$\overline{\text{EM_CS4}}$ /GP[32]	E19	H22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA (NAND) and GPIO. For EMIFA, it is Chip Select 4 output $\overline{\text{EM_CS4}}$ for use with NAND flash. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
$\overline{\text{EM_CS5}}$ /GP[33]	F19	J22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA (NAND) and GPIO. For EMIFA, it is Chip Select 5 output $\overline{\text{EM_CS5}}$ for use with NAND flash. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

EMAC					
HCNTL1/MTXEN/ GP[75]	D3	C4	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Transmit Enable output MTXEN.
HD15/MTXCLK/ GP[73]	A4	A4	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Transmit Clock input MTXCLK.
HD9/MCOL/ GP[67]	C6	C6	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Collision Detect input MCOL.
HD11/MTXD3/ GP[69]	C5	A5	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Transmit Data 3 output MTXD3.
HD12/MTXD2/ GP[70]	D5	C5	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Transmit Data 2 output MTXD2.
HD13/MTXD1/ GP[71]	B4	B4	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Transmit Data 1 output MTXD1.
HD14/MTXD0/ GP[72]	D4	B5	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Transmit Data 0 output MTXD0.
HR \overline{W} /MRXCLK/ GP[77]	A3	A3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Receive Clock input MRXCLK.
HHWIL/MRXDV/ GP[74]	C4	D3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Receive Data Valid input MRXDV.
HCNTL0/MRXER/ GP[76]	B3	B2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Receive Error input MRXER.
HD10/MCRS/ GP[68]	B5	B6	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Carrier Sense input MCRS.
HINT/MRXD3/ GP[82]	C2	D2	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Receive Data 3 input MRXD3.
HRDY/MRXD2/ GP[80]	D2	C3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Receive Data 2 input MRXD2.
HDS1/MRXD1/ GP[79]	B2	B3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Receive data 1 input MRXD1.
HDS2/MRXD0/ GP[78]	C3	C2	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, Ethernet MAC (EMAC), and GPIO. In Ethernet MAC mode, it is Receive Data 0 input MRXD0.
MDIO					
HCS/MDCLK/ GP[81]	C1	D1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, MDIO, and GPIO. In Ethernet MAC mode, it is Management Data Clock output MDCLK.
HAS/MDIO/ GP[83]	D1	C1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, MDIO, and GPIO. In Ethernet MAC mode, it is Management Data IO MDIO (I/O/Z).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

HHWIL/MRXDV/ GP[74]	C4	D3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC, and GPIO. In HPI mode, this pin is half-word identification input HHWIL (I).
HCNTL1/MTXEN/ GP[75]	D3	C4	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC, and GPIO. In HPI mode, this pin is control input 1 HCNTL1 (I). The state of HCNTL1 and HCNTL0 determines if address, data, or control information is being transmitted between an external host and the DM6435.
HCNTL0/MRXER/ GP[76]	B3	B2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC, and GPIO. In HPI mode, this pin is control input 0 HCNTL0 (I). The state of HCNTL1 and HCNTL0 determines if address, data, or control information is being transmitted between an external host and the DM6435.
HR/ \overline{W} /MRXCLK/ GP[77]	A3	A3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC, and GPIO. In HPI mode, this pin is host read or write select HR/ \overline{W} (I).
$\overline{HDS2}$ /MRXD0/ GP[78]	C3	C2	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC, and GPIO. In HPI mode, this pin is host data strobe input 2 HDS2 (I).
$\overline{HDS1}$ /MRXD1/ GP[79]	B2	B3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC, and GPIO. In HPI mode, this pin is host data strobe input 1 HDS1 (I).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-15. Host-Port Interface Terminal Functions (continued)

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
$\overline{\text{HRDY}}/\text{MRXD2}/\text{GP}[80]$	D2	C3	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, EMAC, and GPIO. In HPI mode, this pin is host ready output from DSP to host (O/Z).
$\overline{\text{HCS}}/\text{MDCLK}/\text{GP}[81]$	C1	D1	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, MDIO, and GPIO. In HPI mode, this pin is HPI active low chip select input $\overline{\text{HCS}}$ (I).
$\overline{\text{HINT}}/\text{RXD3}/\text{GP}[82]$	C2	D2	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, EMAC, and GPIO. In HPI mode, this pin is host interrupt output $\overline{\text{HINT}}$ (O/Z).
$\overline{\text{HAS}}/\text{MDIO}/\text{GP}[83]$	D1	C1	I/O/Z	IPU DV_{DD33}	This pin is multiplexed between HPI, MDIO, and GPIO. In HPI mode, this pin is host address strobe $\overline{\text{HAS}}$ (I). For proper HPI operation, if this pin is routed out, it must be pulled up via an external resistor.

Table 2-16. VPFE Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
VIDEO/IMAGE IN (VPFE)					
PCLK/GP[54]	A14	A18	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. In VPFE mode, this pin is the pixel clock input (PCLK) used to load image data into the CCD Controller (CCDC) on pins CI[7:0] and YI[7:0].
VD/GP[53]	A13	A17	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. In VPFE mode, this pin is the vertical synchronization signal (VD) that can be either an input (slave mode) or an output (master mode), which signals the start of a new frame to the CCDC.
HD/GP[52]	A15	A19	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. In VPFE mode, this pin is the horizontal synchronization signal (HD) that can be either an input (slave mode) or an output (master mode), which signals the start of a new line to the CCDC.
CI7(CCD15)/ EM_A[13]/GP[51]	B10	A12	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. When used by the CCDC as input CI7, it supports several modes: In 16-bit CCD Raw mode, it is input CCD15. In 16-bit YCbCr mode, it is time multiplexed between CB7, and CR7 inputs. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y7, CB7, and CR7 of the upper 8-bit channel. ⁽⁴⁾
CI6(CCD14)/ EM_A[14]/GP[50]	A10	A13	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. When used by the CCDC as input CI6, it supports several modes: In 16-bit CCD Raw mode, it is input CCD14. In 16-bit YCbCr mode, it is time multiplexed between CB6, and CR6 inputs. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y6, CB6, and CR6 of the upper 8-bit channel. ⁽⁴⁾
CI5(CCD13)/ EM_A[15]/GP[49]	B11	C13	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. When used by the CCDC as input CI5, it supports several modes: In 16-bit CCD Raw mode, it is input CCD13. In 16-bit YCbCr mode, it is time multiplexed between CB5 and CR5 inputs. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y5, CB5, and CR5 of the upper 8-bit channel. ⁽⁴⁾
CI4(CCD12)/ EM_A[16]/GP[48]	C11	B13	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. When used by the CCDC as input CI4, it supports several modes: In 16-bit CCD Raw mode, it is input CCD12. In 16-bit YCbCr mode, it is time multiplexed between CB4 and CR4 inputs. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y4, CB4, and CR4 of the upper 8-bit channel. ⁽⁴⁾

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

(4) In addition to these default functions, in YCbCr mode, the VPFE CCD Configuration register CCDCFG.YCINSWP bit field allows the user to swap the function of the YI[7:0] and CI[7:0] pins.

Table 2-16. VPFE Terminal Functions (continued)

NAME	ZWT NO.	ZDU NO.			
CI3(CCD11)/ EM_A[17]/GP[47]	A11	B14	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. When used by the CCDC as input CI3, it supports several modes: In 16-bit CCD Raw mode, it is input CCD11. In 16-bit YCbCr mode, it is time multiplexed between CB3 and CR3 inputs. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y3, CB3, and CR3 of the upper 8-bit channel. ⁽⁴⁾
CI2(CCD10)/ EM_A[18]/GP[46]	D11	A14	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. This pin is CCDC input CI2 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD10. In 16-bit YCbCr mode, it is time multiplexed between CB2 and CR2 inputs. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y2, CB2, and CR2 of the upper 8-bit channel. ⁽⁴⁾
CI1(CCD9)/ EM_A[19]/GP[45]	B12	C14	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. This pin is CCDC input CI1 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD9. In 16-bit YCbCr mode, it is time multiplexed between CB1 and CR1 inputs. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y1, CB1, and CR1 of the upper 8-bit channel. ⁽⁴⁾
CI0(CCD8)/ EM_A[20]/GP[44]	C12	C15	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC), EMIFA, and GPIO. This pin is CCDC input CI0 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD8. In 16-bit YCbCr mode, it is time multiplexed between CB0 and CR0 inputs. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y0, CB0, and CR0 of the upper 8-bit channel. ⁽⁴⁾
YI7(CCD7)/ GP[43]	A12	A15	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. his pin is CCDC input YI7 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD7. In 16-bit YCbCr mode, it is input Y7. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y7, CB7, and CR7 of the lower 8-bit channel. ⁽⁴⁾
YI6(CCD6)/ GP[42]	B13	B15	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input YI6 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD6. In 16-bit YCbCr mode, it is input Y6. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y6, CB6, and CR6 of the lower 8-bit channel. ⁽⁴⁾
YI5(CCD5)/ GP[41]	C13	B16	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input YI5 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD5. In 16-bit YCbCr mode, it is input Y5. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y5, CB5, and CR5 of the lower 8-bit channel. ⁽⁴⁾

Table 2-16. VPFE Terminal Functions (continued)

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
YI4(CCD4)/ GP[40]	D14	C18	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE(CCDC) and GPIO. This pin is CCDC input YI4 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD4. In 16-bit YCbCr mode, it is input Y4. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y4, CB4, and CR4 of the lower 8-bit channel. ⁽⁴⁾
YI3(CCD3)/ GP[39]	B14	A16	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input YI3 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD3. In 16-bit YCbCr mode, it is input Y3. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y3, CB3, and CR3 of the lower 8-bit channel. ⁽⁴⁾
YI2(CCD2)/ GP[38]	C14	B17	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input YI2 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD2. In 16-bit YCbCr mode, it is input Y2. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y2, CB2, and CR2 of the lower 8-bit channel. ⁽⁴⁾
YI1(CCD1)/ GP[37]	B15	B18	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input YI1 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD1. In 16-bit YCbCr mode, it is input Y1. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y1, CB1, and CR1 of the lower 8-bit channel. ⁽⁴⁾
YI0(CCD0)/ GP[36]	C15	B19	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the VPFE (CCDC) and GPIO. This pin is CCDC input YI0 and it supports several modes: In 16-bit CCD Raw mode, it is input CCD0. In 16-bit YCbCr mode, it is input Y0. ⁽⁴⁾ In 8-bit YCbCr mode, it is time multiplexed between Y0, CB0, and CR0 of the lower 8-bit channel. ⁽⁴⁾
C_WE/EM_R \overline{W} / GP[35]	D13	C17	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between VPFE (CCDC), EMIFA, and GPIO. In VPFE mode, it is the CCD Controller write enable input C_WE.
C_FIELD/EM_A[21]/ GP[34]	D12	C16	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between VPFE (CCDC), EMIFA, and GPIO. In VPFE mode, it is CCDC field identification bidirectional signal C_FIELD.

Table 2-17. I2C Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
I2C					
SCL	M2	N2	I/O/Z	DV _{DD33}	For I2C, this pin is I2C clock. In I2C master mode, this pin is an output. In I2C slave mode, this pin is an input. When the I2C module is used, for proper device operation, this pin must be pulled up via an external resistor.
SDA	M3	P2	I/O/Z	DV _{DD33}	For I2C, this pin is the I2C bi-directional data signal. When the I2C module is used, for proper device operation, this pin must be pulled up via an external resistor.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-18. Multichannel Buffered Serial Port 0 (McBSP0) Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
Multichannel Buffered Serial Port 0 (McBSP0)					
For more details on pin multiplexing, see Section 3.7, <i>Multiplexed Pin Configurations</i>.					
CLKS0/TOUT0L/ GP[97]	J4	L3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McBSP0, Timer0, and GPIO. For McBSP0, it is McBSP0 external clock source (I).
ACLKR0/CLKX0/ GP[99]	H1	J1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 transmit clock CLKX0 (I/O/Z).
AHCLKR0/CLKR0/ GP[101]	J2	K1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 receive clock CLKR0 (I/O/Z).
AXR0[2]/FSX0/ GP[103]	H3	J2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 transmit frame synchronization FSX0 (I/O/Z).
AXR0[3]/FSR0/ GP[102]	G4	J3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 receive frame synchronization FSR0 (I/O/Z).
AXR0[1]/DX0/ GP[104]	J3	K2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 data transmit output DX0 (O/Z).
AFSR0/DR0/ GP[100]	H4	K3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 data receive input DR0 (I).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1](#), *Pullup/Pulldown Resistors*.

(3) Specifies the operating I/O supply voltage for each signal

Table 2-19. Multichannel Audio Serial Port (McASP0) Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
McASP0					
AMUTEIN0/GP[109]	F2	G3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 mute input AMUTEIN0 (I).
AMUTE0/GP[110]	G3	H3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 mute output AMUTE0 (O/Z).
ACLKR0/CLKX0/GP[99]	H1	J1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive bit clock ACLKR0 (I/O/Z).
AHCLKR0/CLKR0/GP[101]	J2	K1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive high-frequency master clock AHCLKR0 (I/O/Z).
ACLKX0/GP[106]	F1	G1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit bit clock ACLKX0 (I/O/Z).
AHCLKX0/GP[108]	G1	H1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit high-frequency master clock AHCLKX0 (I/O/Z).
AFSR0/DR0/GP[100]	H4	K3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive frame synchronization AFSR0 (I/O/Z).
AFSX0/GP[107]	G2	G2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit frame synchronization AFSX0 (I/O/Z).
AXR0[3]/FSR0/GP[102]	G4	J3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 3 AXR0[3] (I/O/Z).
AXR0[2]/FSX0/GP[103]	H3	J2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 2 AXR0[2] (I/O/Z).
AXR0[1]/DX0/GP[104]	J3	K2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 1 AXR0[1] (I/O/Z).
AXR0[0]/GP[105]	H2	H2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 0 AXR0[0] (I/O/Z).

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-20. High-End Controller Area Network (HECC)

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
HECC					
HECC_RX/ TINP1L/ URXD1/ GP[56]	L4	P3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HECC, Timer 1, UART1, and GPIO. For HECC, this pin is HECC receive serial data HECC_RX (I).
HECC_TX/ TOUT1L/ UTXD1/ GP[55]	K4	N3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HECC, Timer 1, UART1, and GPIO. For HECC, this pin is HECC transmit serial data HECC_TX (O/Z).

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
(3) Specifies the operating I/O supply voltage for each signal

Table 2-21. UART0 and UART1 Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
UART1					
HECC_RX/ TINP1L/ URXD1/ GP[56]	L4	P3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the HECC, Timer 1, UART1 (Data), and GPIO. Fo UART1 this pin is the receive data input URXD1.
HECC_TX/ TOUT1L/ UTXD1/ GP[55]	K4	N3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the HECC, Timer 1, UART1 (Data), and GPIO. Fo UART1 this pin is the transmit data output UTXD1.
UART0					
URXD0/ GP[85]	L2	M2	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between UART0 (Data) and GPIO. When used by UART0 this pin is the receive data input URXD0.
UTXD0/ GP[86]	K3	N1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between UART0 (Data) and GPIO. In UART0 mode, this pin is the transmit data output UTXD0.
UCTS0 GP[87]	L1	P1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the UART0 (Flow Control) and GPIO. In UART0 mode, this pin is the clear to send input UCTS0.
URTS0 PWM0 GP[88]	L3	M3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the UART0 (Flow Control), PWM0, and GPIO. In UART0 mode, this pin is the ready to send output URTS0.

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-22. PWM0, PWM1, and PWM2 Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
PWM2					
CLKOUT0/PWM2/ GP[84]	M1	R1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the System Clock generator (PLL1), PWM2, and GPIO. For PWM2, this pin is output PWM2.
PWM1					
GP[4]/PWM1	F3	F3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between GPIO and PWM1. For PWM1, this pin is output PWM1.
PWM0					
URTS0/PWM0/ GP[88]	L3	M3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the UART0 (Flow Control), PWM0, and GPIO. For PWM0, this pin is output PWM0.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-23. Timer 0, Timer 1, and Timer 2 Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
Timer 2					
No external pins. The Timer 2 (watchdog) peripheral pins are not pinned out as external pins.					
Timer 1					
HECC_RX/ TINP1L/ URXD1/ GP[56]	L4	P3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the HECC, Timer 1, UART1 (Data), and GPIO. For Timer 1, this pin is the timer 1 input pin for the lower 32-bit counter
HECC_TX/ TOUT1L/ UTXD1/ GP[55]	K4	N3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the HECC, Timer 1, UART1, and GPIO. For Timer 1, this pin is the timer 1 output pin for the lower 32-bit counter
Timer 0					
TINP0L/ GP[98]	K2	L2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the Timer 0 and GPIO. For Timer 0, this pin is the timer 0 input pin for the lower 32-bit counter
CLKS0/ TOUT0L/ GP[97]	J4	L3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the McBSP0, Timer 0, and GPIO. For Timer 0, this pin is the timer 0 output pin for the lower 32-bit counter

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

2.7 Device Support

2.7.1 Development Support

TI offers an extensive line of development tools for the TMS320DM643x DMP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of TMS320DM643x DMP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools
Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any SoC application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports TMS320DM643x DMP multiprocessor system debug) EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320DM643x DMP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

2.8 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMX320DM6435ZWT400**). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- TMX** Experimental device that is not necessarily representative of the final device's electrical specifications.
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification.
- TMS** Fully-qualified production device.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product.

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ZWT), the temperature range (for example, "Blank" is the commercial temperature range), and the device speed range in megahertz (for example, "6" indicates [600-MHz]).

Figure 2-10 provides a legend for reading the complete device name for any TMS320DM643x DMP platform member.

- A. BGA = Ball Grid Array
- B. For "TMX" initial devices, the device number is DM6437.
- C. Not all combinations are available. For more information, see the *Orderable Devices* table in the Packing Information section.
- D. The maximum CPU frequency for the -Q6 device is 660 MHz. See the *PLL1 and PLL2* section for maximum operating frequencies of the PLL1 controller.
- E. The device speed range symbolization indicates the maximum CPU frequency when the core voltage (CV_{DD}) is set to 1.2 V. To determine the maximum CPU frequency the core voltage is set to 1.05 V, refer to the *PLL1 and PLL2* section.

Figure 2-10. Device Nomenclature

2.9 Documentation Support

2.9.1 Related Documentation From Texas Instruments

The following documents describe the TMS320DM643x Digital Media Processor (DMP). Copies of these documents are available on the Internet at www.ti.com. *Tip:* Enter the literature number in the search box provided at www.ti.com.

The current documentation that describes the DM643x DMP, related peripherals, and other technical collateral, is available in the C6000 DSP product folder at: www.ti.com/c6000.

[SPRU978](#) **TMS320DM643x DMP DSP Subsystem Reference Guide.** Describes the digital signal processor (DSP) subsystem in the TMS320DM643x Digital Media Processor (DMP).

[SPRU983](#) **TMS320DM643x DMP Peripherals Overview Reference Guide.** Provides an overview and briefly describes the peripherals available on the TMS320DM643x Digital Media Processor (DMP).

[SPRAA84](#) **TMS320C64x to TMS320C64x+ CPU Migration Guide.** Describes migrating from the Texas Instruments TMS320C64x digital signal processor (DSP) to the TMS320C64x+ DSP. The objective of this document is to indicate differences between the two cores. Functionality in the devices that is identical is not included.

[SPRU732](#) **TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide.** Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C64x and TMS320C64x+ digital signal processors (DSPs) of the TMS320C6000 DSP family. The C64x/C64x+ DSP generation comprises fixed-point devices in the C6000 DSP platform. The C64x+ DSP is an enhancement of the C64x DSP with added functionality and an expanded instruction set.

[SPRU871](#) **TMS320C64x+ DSP Megamodule Reference Guide.** Describes the TMS320C64x+ digital signal processor (DSP) megamodule. Included is a discussion on the internal direct memory access (IDMA) controller, the interrupt controller, the power-down controller, memory protection, bandwidth management, and the memory and cache.

3 Device Configuration

3.1 System Module Registers

The system module includes status and control registers required for configuration of the device. Brief descriptions of the various registers are shown in [Table 3-1](#). System Module registers required for device configurations are discussed in the following sections.

Table 3-1. System Module Register Memory Map

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION
0x01C4 0000	PINMUX0	Pin Multiplexing Control 0 (see Section 3.7.2.1 , <i>PINMUX0 Register Description</i>).
0x01C4 0004	PINMUX1	Pin Multiplexing Control 1 (see Section 3.7.2.2 , <i>PINMUX1 Register Description</i>).
0x01C4 0008	DSPBOOTADDR	DSP Boot Address (see Section 3.4.2.3 , <i>DSPBOOTADDR Register</i>).
0x01C4 000C	BOOTCOMPLT	Boot Complete (see Section 3.4.2.2 , <i>BOOTCOMPLT Register</i>).
0x01C4 0010	–	Reserved
0x01C4 0014	BOOTCFG	Device Boot Configuration (see Section 3.4.2.1 , <i>BOOTCFG Register</i>).
0x01C4 0018 - 0x01C4 0027	–	Reserved
0x01C4 0028	JTAGID	JTAG ID (see Section 6.23.1 , <i>JTAG ID (JTAGID) Register Description(s)</i>).
0x01C4 002C	–	Reserved
0x01C4 0030	HPICTL	HPI Control (see Section 3.6.2.1 , <i>HPI Control Register</i>).
0x01C4 0034	–	Reserved
0x01C4 0038	–	Reserved
0x01C4 003C	MSTPRI0	Bus Master Priority Control 0 (see Section 3.6.1 , <i>Switch Central Resource (SCR) Bus Priorities</i>).
0x01C4 0040	MSTPRI1	Bus Master Priority Control 1 (see Section 3.6.1 , <i>Switch Central Resource (SCR) Bus Priorities</i>).
0x01C4 0044	VPSS_CLKCTL	VPSS Clock Control (see Section 3.3.2 , <i>VPSS Clocks</i>).
0x01C4 0048	VDD3P3V_PWDN	V _{DD} 3.3-V I/O Powerdown Control (see Section 3.2 , <i>Power Considerations</i>).
0x01C4 004C	DDRVTPER	DDR2 VTP Enable Register (see Section 6.9.4 , <i>DDR2 Memory Controller</i>).
0x01C4 0050 - 0x01C4 0080	–	Reserved
0x01C4 0084	TIMERCTL	Timer Control (see Section 3.6.2.2 , <i>Timer Control Register</i>).
0x01C4 0088	EDMATCCFG	EDMA Transfer Controller Default Burst Size Configuration (see Section 3.6.2.3 , <i>EDMA TC Configuration Register</i>).
0x01C4 008C	–	Reserved

3.2 Power Considerations

The DM6435 provides several means of managing power consumption.

As described in the [Section 6.3.4, DM6435 Power and Clock Domains](#), the DM6435 has one single power domain—the “Always On” power domain. Within this power domain, the DM6435 utilizes local clock gating via the Power and Sleep Controller (PSC) to achieve power savings. For more details on the PSC, see [Section 6.3.5, Power and Sleep Controller \(PSC\)](#) and the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

Some of the DM6435 peripherals support additional power saving features. For more details on power saving features supported, see the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number [SPRU983](#)).

Most DM6435 3.3-V I/Os can be powered-down to reduce power consumption. The VDD3P3V_PWDN register in the System Module (see [Figure 3-1](#)) is used to selectively power down unused 3.3-V I/O pins. For independent control, the 3.3-V I/Os are separated into functional groups—most of which are named according to the pin multiplexing groups (see [Table 3-2](#)). For these I/O groups, only the I/O buffers needed for Host/EMIFA Boot or Power-Up Operations are powered up by default (CLKOUT Block, EMIFA/VPSS Block, Host Block, and GPIO Block).

Note: To save power, all other I/O buffers are powered down by default. Before using these pins, the user *must* program the VDD3P3V_PWDN register to power up the corresponding I/O buffers.

For a list of multiplexed pins on the device and the pin mux group each pin belongs to, see [Section 3.7.3.1, Multiplexed Pins on DM6435](#).

31

16

Figure 3-1. VDD3P3V_PWDN Register

Table 3-2. VDD3P3V_PWDN Register Bit Descriptions⁽¹⁾

BIT	NAME	DESCRIPTION
31:14	RESERVED	Reserved. Read-only, writes have no effect.
13	RSV	Reserved. This bit should be programmed to 1 during device initialization (see Section 3.8, Device Initialization Sequence After Reset).
12	EMBK3	EMIFA/VPSS Sub-Block 3 I/O Power Down Control. Controls the power of the 8 I/O pins in the EMIFA/VPSS Sub-Block 3. 0 = I/O pins powered up [default]. 1 = I/O pins powered down and <i>not</i> operational. Outputs are 3-stated (Hi-Z).
11	UR0FC	UART0 Flow Control Block I/O Power Down Control. Controls the power of the 2 I/O pins in the UART0 Flow Control Block. 0 = I/O pins powered up. 1 = I/O pins powered down and <i>not</i> operational. Outputs are 3-stated (Hi-Z) [default].

(1) For more details on I/O pins belonging to each pin mux block, see [Section 3.7, Multiplexed Pin Configurations](#).

Table 3-2. VDD3P3V_PWDN Register Bit Descriptions (continued)

BIT	NAME	DESCRIPTION
10	UR0DAT	<p>UART0 Data Block I/O Power Down Control. Controls the power of the 2 I/O pins in the UART0 Data Block.</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p>
9	TIMER1	<p>Timer1 Block I/O Power Down Control. Controls the power of the 2 I/O pins in the Timer1 Block.</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p>
8	TIMER0	<p>Timer0 Block I/O Power Down Control. Controls the power of the 2 I/O pins in the Timer0 Block.</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p>
7	SP	<p>Serial Port Block I/O Power Down Control. Controls the power of the 12 I/O pins in the Serial Port Block (Serial Port Sub-Block 0 and Serial Port Sub-Block 1).</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p>
6	PWM1	<p>PWM1 Block I/O Power Down Control. Controls the power of the 1 I/O pin in the PWM1 Block.</p> <p>0 = I/O pins powered up.</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].</p>
5	GPIO	<p>GPIO Block I/O Power Down Control. Controls the power of the 4 I/O pins in the GPIO Block (GP[3:0]). Note: The GPIO Block contains standalone GPIO pins and is not a pin mux group.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p>
4	HOST	<p>Host Block I/O Power Down Control. Controls the power of the 27 I/O pins in the Host Block.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p>
3	EMBK2	<p>EMIFA/VPSS Sub-Block 2 I/O Power Down Control. Controls the power of the 3 I/O pins in the EMIFA/VPSS Sub-Block 2.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p>
2	EMBK1	<p>EMIFA/VPSS Sub-Block 1 I/O Power Down Control. Controls the power of the 29 I/O pins in the EMIFA/VPSS Sub-Block 1.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p>
1	EMBK0	<p>EMIFA/VPSS Sub-Block 0 I/O Power Down Control. Controls the power of the 21 I/O pins in the EMIFA/VPSS Sub-Block 0.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p>
0	CLKOUT	<p>CLKOUT Block I/O Power Down Control. Controls the power of the 1 I/O pin in the CLKOUT Block.</p> <p>0 = I/O pins powered up [default].</p> <p>1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).</p>

3.3 Clock Considerations

Global device and local peripheral clocks are controlled by the PLL Controllers (PLL1 and PLL2) and the Power and Sleep Controller (PSC). In addition, the System Module VPSS_CLKCTL register configures the clock source to the Video Processing Subsystem (VPSS).

3.3.1 Clock Configurations after Device Reset

After device reset, the user is responsible for programming the PLL Controllers (PLL1 and PLL2) and the Power and Sleep Controller (PSC) to bring the device up to the desired clock frequency and the desired peripheral clock state (clock gating or not).

For additional power savings, some of the DM6435 peripherals support clock gating within the peripheral boundary. For more details on clock gating and power saving features supported by a specific peripheral, see the peripheral-specific reference guides [listed/linked in the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number [SPRU983](#))].

3.3.1.1 Device Clock Frequency

The DM6435 defaults to PLL bypass mode. To bring the device up to the desired clock frequency, the user should program PLL1 and PLL2 after device reset.

DM6435 supports a FASTBOOT option, where upon exit from device reset the internal bootloader code automatically programs the PLL1 into PLL mode with a specific PLL multiplier and divider to speed up device boot. While the FASTBOOT option is beneficial for faster boot, the PLL multiplier and divider selected for boot *may not* be the exact frequency desired for the run-time application. It is the user's responsibility to reconfigure PLL1 after fastboot to bring the device into the desired clock frequency. [Section 3.4.1, Boot Modes](#) discusses the different fast boot modes in more detail.

The user **must** adhere to the various clock requirements when programming the PLL1 and PLL2:

- Fixed frequency ratio requirements between CLKDIV1, CLKDIV3, and CLKDIV6 clock domains. For more details on the frequency ratio requirements, see [Section 6.3.4, DM6435 Power and Clock Domains](#).
- PLL multiplier and frequency ranges. For more details on PLL multiplier and frequency ranges, see [Section 6.7.1, PLL1 and PLL2](#).

3.3.1.2 Module Clock State

The clock and reset state for each of the modules is controlled by the Power and Sleep Controller (PSC). [Table 3-3](#) shows the default state of each module after a device-level global reset. The DM6435 device has four different module states—Enable, Disable, SyncReset, or SwRstDisable. For more information on the definitions of the module states, the PSC, and PSC programming, see [Section 6.3.5, Power and Sleep Controller \(PSC\)](#) and the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

Table 3-3. DM6435 Default Module States

LPSC #	MODULE NAME	DEFAULT MODULE STATE [PSC Register MDSTATn.STATE]
0	VPSS (Master)	SwRstDisable
1	VPSS (Slave)	SwRstDisable
2	EDMACC	SwRstDisable
3	EDMATC0	SwRstDisable
4	EDMATC1	SwRstDisable
5	EDMATC2	SwRstDisable
6	EMAC Memory Controller	SwRstDisable
7	MDIO	SwRstDisable
8	EMAC	SwRstDisable
9	McASP0	SwRstDisable
11	VLYNQ	SwRstDisable
12	HPI	SwRstDisable
13	DDR2 Memory Controller	SwRstDisable
14	EMIFA	SwRstDisable, if configuration pins AEM[2:0] = 000b Enable, if configuration pins AEM[2:0] = Others [001b and 101b]
16	McBSP0	SwRstDisable
18	I2C	SwRstDisable
19	UART0	SwRstDisable
20	UART1	SwRstDisable
22	HECC	SwRstDisable
23	PWM0	SwRstDisable
24	PWM1	SwRstDisable
25	PWM2	SwRstDisable
26	GPIO	SwRstDisable
27	TIMER0	SwRstDisable
28	TIMER1	SwRstDisable
39	C64x+ CPU	Enable

3.3.2 VPSS Clocks

The Video Processing SubSystem (VPSS) clocks are controlled via the VPSS_CLKCTL register. The VPSS_CLKCTL register format is shown in [Figure 3-2](#) and the bit field descriptions are given in [Table 3-4](#).

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-2. VPSS_CLKCTL Register

Table 3-4. VPSS_CLKCTL Register Bit Description

BIT	NAME	DESCRIPTION
31:5	RESERVED	Reserved. Read-only, writes have no effect.
4:3	RESERVED	Reserved. For proper device operation, the user must only write "0" to these bits.
2	PCLKINV	PCLK polarity 0 = VPSS receives normal PCLK [default]. 1 = VPSS receives inverted PCLK.
1:0	RESERVED	Reserved. For proper device operation, the user must only write "0" to these bits.

3.4 Boot Sequence

The boot sequence is a process by which the device's memory is loaded with program and data sections, and by which some of the device's internal registers are programmed with predetermined values. The boot sequence is started automatically after each device-level global reset. For more details on device-level global resets, see [Section 6.5, Reset](#).

There are several methods by which the memory and register initialization can take place. Each of these methods is referred to as a boot mode. The boot mode to be used is selected at reset. For more information on the bootmode selections, see [Section 3.4.1, Boot Modes](#).

The device is booted through multiple means—primary bootloaders within internal ROM or EMIFA, and secondary user bootloaders from peripherals or external memories. Boot modes, pin configurations, and register configurations required for booting the device, are described in the following subsections.

3.4.1 Boot Modes

The DM6435 boot modes are determined by these device boot and configuration pins. For information on how these pins are sampled at device reset, see [Section 6.5.1.2, Latching Boot and Configuration Pins](#).

- BOOTMODE[3:0]
- FASTBOOT
- AEM[2:0]
- PLLMS[2:0]

Note: the PLLMS[2:0] configuration pins are actually multiplexed with the AEAW[2:0] configuration pins. For more details on the multiplexed AEAW[2:0]/PLLMS[2:0] configuration pins and control, see [Section 3.5.1.2, EMIFA Address Width Selects \(AEAW\[2:0\]\) and FASTBOOT PLL Multiplier Selects \(PLLMS\[2:0\]\)](#).

BOOTMODE[3:0] determines the type of boot (e.g., I2C Boot, EMIFA Boot, or HPI Boot, etc.). FASTBOOT determines if the PLL is enabled during boot to speed up the boot process.

The combination of AEM[2:0] and PLLMS[2:0] is used by bootloader code to determine the PLL multiplier used during fastboot modes (FASTBOOT = 1).

The DM6435 boot modes are grouped into three categories—Non-Fastboot Modes, Fixed-Multiplier Fastboot Modes, and User-Select Multiplier Fastboot Modes.

- **Non-Fastboot Modes (FASTBOOT = 0):** The device operates in default PLL bypass mode during boot. The Non-Fastboot bootmodes available on the DM6435 are shown in [Table 3-5](#).
- **Fixed-Multiplier Fastboot Modes (FASTBOOT = 1, AEM[2:0] = 001b):** The bootloader code speeds up the device during boot according to the fixed PLL multipliers. The Fixed-Multiplier Fastboot bootmodes available on the DM6435 are shown in [Table 3-6](#).
Note: The PLLMS[2:0] configurations have *no* effect on the Fixed-Multiplier Fastboot Modes, as these pins function as AEAW[2:0] to select the EMIFA address width when AEM[2:0] = 001b.
- **User-Select Multiplier Fastboot Modes (FASTBOOT = 1, AEM[2:0] = 000b and 101b):** The bootloader code speeds up the device during boot. The PLL multiplier is selected by the user via the PLLMS[2:0] pins. The User-Select Multiplier Fastboot bootmodes available on the DM6435 are shown in [Table 3-7](#).

All other modes *not* shown in these tables are reserved and invalid settings.

For more information on how these pins are sampled at device reset, see [Section 6.5.1.2, Latching Boot and Configuration Pins](#).

Table 3-5. Non-Fastboot Modes (FASTBOOT = 0)

DEVICE BOOT AND CONFIGURATION PINS	BOOT DESCRIPTION ⁽¹⁾	DM6435 DMP (Master/Slave)	PLL1 CLOCK SETTING AT BOOT			DSPBOOTADDR (DEFAULT) ⁽¹⁾
			PLL MODE ⁽²⁾	CLKDIV1 DOMAIN (SYSCLK1 DIVIDER)	DEVICE FREQUENCY (SYSCLK1)	
BOOTMODE[3:0]						
0000	No Boot (Emulation Boot)	Master	Bypass	/1	CLKIN	0x0010 0000
0001	Reserved	–	–	–	–	–
0010	HPI Boot	Slave	Bypass	/1	CLKIN	0x0010 0000
0011	Reserved	–	–	–	–	–
0100	EMIFA ROM Direct Boot [PLL Bypass Mode]	Master	Bypass	/1	CLKIN	0x4200 000
0101	I2C Boot [STANDARD MODE] ⁽³⁾	Master	Bypass	/1	CLKIN	0x0010 0000
0110	16-bit SPI Boot [McBSP0]	Master	Bypass	/1	CLKIN	0x0010 0000
0111	NAND Flash Boot	Master	Bypass	/1	CLKIN	0x0010 0000
1000	UART Boot without Hardware Flow Control [UART0]	Master	Bypass	/1	CLKIN	0x0010 0000
1001	Reserved	–	–	–	–	–
1010	VLYNQ Boot	Slave	Bypass	/1	CLKIN	0x0010 0000
1011	Reserved	–	–	–	–	–
1100	Reserved	–	–	–	–	–
1101	Reserved	–	–	–	–	–
1110	UART Boot with Hardware Flow Control [UART0]	Master	Bypass	/1	CLKIN	0x0010 0000
1111	24-bit SPI Boot (McBSP0 + GP[97])	Master	Bypass	/1	CLKIN	0x0010 0000

- (1) For all boot modes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).
- (2) The PLL MODE for Non-Fastboot Modes is fixed as shown in this table; therefore, the PLLMS[2:0] configuration pins have no effect on the PLL MODE.
- (3) I2C Boot (BOOTMODE[3:0] = 0101b) is *only* available if the MXI/CLKIN frequency is between 21 MHz to 30 MHz. I2C Boot is *not* available for MXI/CLKIN frequencies less than 21 MHz.

Table 3-6. Fixed-Multiplier Fastboot Modes (FASTBOOT = 1, AEM[2:0] = 001b)

DEVICE BOOT AND CONFIGURATION PINS	BOOT DESCRIPTION ⁽¹⁾	DM6435 DMP (Master/Slave)	PLL1 CLOCK SETTING AT BOOT			DSPBOOTADDR (DEFAULT) ⁽¹⁾
			PLL MODE ⁽²⁾	CLKDIV1 DOMAIN (SYSCLK1 DIVIDER)	DEVICE FREQUENCY (SYSCLK1)

- (1) For all boot modes that default to DSPBOOTADDR = 0x0010 0000, the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).
- (2) Any *supported* PLL MODE is available. [See [Table 3-8](#) for supported DM6435 PLL MODE options].
- (3) I2C Boot (BOOTMODE[3:0] = 0101b) is *only* available if the MXI/CLKIN frequency is between 21 MHz to 30 MHz. I2C Boot is *not* available for MXI/CLKIN frequencies less than 21 MHz.

Table 3-8. PLL Multiplier Selection (PLLMS[2:0]) in User-Select Multiplier Fastboot Modes (FASTBOOT = 1; AEM[2:0] = 000b or 101b)

DEVICE BOOT AND CONFIGURATION PINS	PLL1 CLOCK SETTING AT BOOT		
	PLL MODE	CLKDIV1 DOMAIN (SYSCLK1 DIVIDER)	DEVICE FREQUENCY (SYSCLK1)
PLLMS[2:0]			
000	x20	/2	CLKIN x20 / 2
001	x15	/2	CLKIN x15 / 2
010	x16	/2	CLKIN x16 / 2
011	x18	/2	CLKIN x18 / 2
100	x22	/2	CLKIN x22 / 2
101	x25	/2	CLKIN x25 / 2
110	x27	/2	CLKIN x27 / 2
111	x30	/2	CLKIN x30 / 2

As shown in [Table 3-5](#), [Table 3-6](#), and [Table 3-7](#), at device reset the Boot Controller defaults the DSPBOOTADDR to one of two values based on the boot mode selected. In all boot modes, the C64x+ is immediately released from reset and begins executing from address location indicated in DSPBOOTADDR.

- **Internal Bootloader ROM (0x0010 0000):** For most boot modes, the DSPBOOTADDR defaults to the internal Bootloader ROM so that the DSP can immediately execute the bootloader code in the internal ROM. The bootloader code decodes the captured BOOTMODE, FASTBOOT, default AEM (DAEM), and PLLMS information (in the BOOTCFG register) to determine the proper boot operation.

Note: For all boot modes that default to DSPBOOTADDR = 0x0010 0000, the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see [Section 3.4.1, Boot Modes](#). For more information on the bootloader, see the *Using the TMS320DM643x Bootloader Application Report* (literature number [SPRAAG0](#)).

- **EMIFA Chip Select Space 2 (0x4200 0000):** The EMIFA ROM Direct Boot in PLL Bypass Mode (BOOTCFG settings BOOTMODE[3:0] = 0100b, FASTBOOT = 0) is the **only** exception where the DSPBOOTADDR defaults to the EMIFA Chip Select Space 2. The DSP begins execution directly from the external ROM at this EMIFA space.

For more information how the bootloader code handles each boot mode, see *Using the TMS320DM643x Bootloader Application Report* (literature number [SPRAAG0](#)).

3.4.1.1 FASTBOOT

When DM6435 exits pin reset ($\overline{\text{RESET}}$ or $\overline{\text{POR}}$ released), the PLL Controllers (PLL1 and PLL2) default to PLL Bypass Mode. This means the PLLs are disabled, and the MXI/CLKIN clock input is driving the chip. All the clock domain divider ratios discussed in [Section 6.3.4, DM6435 Power and Clock Domains](#), still apply. For example, assume an MXI/CLKIN frequency of 27 MHz—meaning the internal clock source for EMIFA is at CLKDIV3 domain = 27 MHz/3 = 9 MHz, a very slow clock. In addition, the EMIFA registers are reset to the slowest configuration which translates to very slow peripheral operation/boot.

To optimize boot time, the user should reprogram clock settings via the PLLC as early as possible during the boot process. The FASTBOOT pin facilitates this operation by allowing the device to boot at a faster clock rate.

Except for the EMIFA ROM Direct Boot in PLL Bypass Mode (BOOTCFG settings BOOTMODE[3:0] = 0100b, FASTBOOT = 0), all other boot modes default to executing from the Internal Bootloader ROM. The first action that the bootloader code takes is to decode the boot mode. If the FASTBOOT option is selected (BOOTCFG.FASTBOOT = 1), the bootloader software begins by programming the PLLC1 (System PLLC) to PLL Mode to give the device a slightly faster operation before fetching code from external devices. The exact PLL multiplier that the bootloader uses is determined by the AEM[2:0] and PLLMS[2:0] settings, as shown in [Table 3-6](#) and [Table 3-7](#).

Some boot modes *must* be accompanied with FASTBOOT = 1 so that the corresponding peripheral can run at a reasonable rate to communicate to the external device(s).

Note: PLLC2 still stays in PLL Bypass Mode, the bootloader *does not* reconfigure it.

3.4.1.2 Selecting FASTBOOT PLL Multiplier

Table 3-6, Table 3-7, and Table 3-8 show the PLL multipliers used by the bootloader code during fastboot (FASTBOOT = 1) and the resulting device frequency. The user is responsible for selecting the bootmode with the appropriate PLL multiplier for their MXI/CLKIN clock source so that the device speed and PLL frequency range requirements are met. For the PLLC1 Clock Frequency Ranges, see Table 6-15, *PLLC1 Clock Frequency Ranges* in Section 6.7.1, *PLL1 and PLL2*.

The following are guidelines for PLL output frequency and device speed (frequency):

- **PLL Output Frequency:** (PLLOUT = CLKIN frequency * boot PLL Multiplier) **must** stay within the PLLOUT frequency range in Table 6-15, *PLLC1 Clock Frequency Ranges*.
- **Device Frequency:** (SYSCLK1) calculated from Table 3-6 and Table 3-7 **must not** exceed the SYSCLK1 maximum frequency in Table 6-15, *PLLC1 Clock Frequency Ranges*.

For example, for a 600-MHz device with a CLKIN = 27 MHz, in order to stay within the PLLOUT frequency range and SYSCLK1 maximum frequency from Table 6-15, *PLLC1 Clock Frequency Ranges*, the user **must** select a boot mode with a PLL1 multiplier between x15 and x22.

3.4.1.3 EMIFA Boot Modes

As shown in Table 3-5, Table 3-6, and Table 3-7, there are different types of EMIFA Boot Modes. This subsection summarizes these types of EMIFA boot modes. For further detailed information, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).

- **EMIFA ROM Direct Boot in PLL Bypass Mode** (FASTBOOT = 0, BOOTMODE[3:0] = 0100b)
 - The C64x+ fetches the code directly from EMIFA Chip Select 2 Space [$\overline{\text{EM_CS2}}$] (address 0x4200 0000)
 - The PLL is in Bypass Mode
 - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] **must** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1].
- **EMIFA ROM Fastboot with AIS** (FASTBOOT = 1, BOOTMODE[3:0] = 0100b)
 - The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
 - The bootloader code programs PLLC1 to PLL Mode to speed up the boot process. The PLL multiplier value is determined by the AEM[2:0] and PLLMS[2:0] configurations as shown in Table 3-6 and Table 3-7.
 - The bootloader code reads code from the EMIFA $\overline{\text{EM_CS2}}$ space using the application image script (AIS) format.
 - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] **must** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1].
- **EMIFA ROM Fastboot without AIS:** (FASTBOOT = 1, BOOTMODE[3:0] = 1001b)
 - The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
 - The bootloader code programs PLLC1 to PLL Mode to speed up the boot process. The PLL multiplier value is determined by the AEM[2:0] and PLLMS[2:0] configurations as shown in Table 3-6 and Table 3-7.
 - The bootloader code then jumps to the EMIFA $\overline{\text{EM_CS2}}$ space, at which point the C64x+ fetches the code directly from address 0x4200 0000.
 - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] **must** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1].

- **NAND Flash Boot:** (FASTBOOT = 0 or 1, BOOTMODE[3:0] = 0111b)
 - The C64x+ begins execution from the internal bootloader ROM at address 0x00100000.
 - Depending on the FASTBOOT, AEM[2:0], and PLLMS[2:0] settings, the bootloader code may program the PLLC1 to PLL Mode to speed up the boot process. See [Table 3-5](#), [Table 3-6](#), and [Table 3-7](#).
 - The bootloader code reads the code from EMIFA (NAND) $\overline{\text{EM_CS2}}$ (address 0x42000000) using AIS format.
 - EMIFA is configured in NAND mode. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0] and AEAW[2:0]. AEM[2:0] **can** be configured to 001b [8-bit EMIFA (Async) Pinout Mode 1] or 101b [8-bit EMIFA (NAND) Pinout Mode 5].

3.4.1.4 Serial Boot Modes (I2C, UART[UART0], SPI[McBSP0])

This subsection discusses how the bootloader configures the clock dividers for the serial boot modes—I2C boot, UART boot, and SPI boot.

3.4.1.4.1 I2C Boot

If FASTBOOT = 0, then I2C Boot (BOOTMODE = 0101) is performed in Standard-Mode (up-to 100 kbps). If FASTBOOT = 1, then I2C Boot is performed in Fast-Mode (up-to 400 kbps). The actual I2C data transfer rate is dependent on the MXI/CLKIN frequency.

This is how the bootloader programs the I2C:

- I2C Boot in Fast-Mode (BOOTMODE[3:0] = 0101b, FASTBOOT = 1)
 - I2C register settings: ICPSC.IPSC = 2₁₀, ICCLKL.ICCL = 8₁₀, ICCKH.ICCH = 8₁₀
 - Resulting in the following I2C prescaled module clock frequency (internal I2C clock):
 - (CLKIN frequency in MHz) / 3
 - Resulting in the following I2C serial clock (SCL):
 - SCL frequency (in kHz) = (CLKIN frequency in MHz) / 78 * 1000
 - SCL low pulse duration (in μs) = 39 / (CLKIN frequency in MHz)
 - SCL high pulse duration (in μs) = 39 / (CLKIN frequency in MHz)
- I2C Boot in Standard-Mode (BOOTMODE[3:0] = 0101b, FASTBOOT = 0)
 - I2C register settings: ICPSC.IPSC = 2₁₀, ICCLKL.ICCL = 45₁₀, ICCKH.ICCH = 45₁₀
 - Resulting in the following I2C prescaled module clock frequency (internal I2C clock):
 - (CLKIN frequency in MHz) / 3
 - Resulting in the following I2C serial clock (SCL):
 - SCL frequency (in kHz) = (CLKIN frequency in MHz) / 300 * 1000
 - SCL low pulse duration (in μs) = 150 / (CLKIN frequency in MHz)
 - SCL high pulse duration (in μs) = 150 / (CLKIN frequency in MHz)

Note: The I2C peripheral requires that the prescaled module clock frequency **must** be between 7 MHz and 12 MHz. Therefore, the I2C boot is *only* available for MXI/CLKIN frequency between 21 MHz and 30 MHz.

For more details on the I2C peripheral configurations and clock requirements, see the *TMS320DM643x DMP Inter-Integrated Circuit (I2C) Peripheral User's Guide* (literature number [SPRU991](#)).

3.4.1.4.2 UART Boot

For UART Boot (BOOTMODE[3:0] = 1000b or 1110b), the bootloader programs the UART0 peripheral as follows:

- UART0 divisor is set to 15_{10}
- Resulting in this UART0 baud rate in kilobit per second (kbps):
 - (CLKIN frequency in MHz) * 1000 / (15 * 16)

The user is responsible for ensuring the resulting baud rate is appropriate for the system. The UART0 divisor (/15) is optimized for CLKIN frequency between 27 to 29 MHz to stay within 5% of the 115200-bps baud rate.

For more details on the UART peripheral configurations and clock generation, see the *TMS320DM643x DMP Universal Asynchronous Receiver/Transmitter (UART) User's Guide* (literature number [SPRU997](#)).

3.4.1.4.3 SPI Boot

Both 16-bit address SPI Boot (BOOTMODE = 0110) and 24-bit address SPI boot are performed through the McBSP0 peripheral. The bootloader programs the McBSP0 peripheral as follows:

- McBSP0 register settings: SRGR.CLKGDV = 2_{10}
- Resulting in this SPI serial clock frequency:
 - (SYSCLK3 frequency in MHz) / 3

SYSCLK3 frequency = SYSCLK1 frequency / 6. SYSCLK1 frequency during boot can be found in [Table 3-5](#), [Table 3-6](#), [Table 3-7](#), and/or [Table 3-8](#) based on the boot mode selection.

For example, if BOOTMODE[3:0] = 0110b, FASTBOOT = 1, the MXI/CLKIN frequency = 27 MHz, AEM[2:0] = 000b, PLLMS[2:0] = 100b, the combination of [Table 3-7](#) and [Table 3-8](#) indicates that the device frequency (SYSCLK1) is $CLKIN \times 22 / 2 = 297$ MHz. This means SYSCLK3 frequency is $297 / 6 = 49.5$ MHz, resulting in SPI serial clock frequency of $49.5 / 3 = 16.5$ MHz.

3.4.1.5 Host Boot Modes

The DM6435 supports HPI Boot.

The HPI Boot is available in fastboot and non-fastboot, as shown in [Table 3-5](#), [Table 3-6](#), and [Table 3-7](#).

Note: the HPI $\overline{HSTROBE}$ inactive pulse duration timing requirement [$t_{w(HSTBH)}$] is dependent on the HPI internal clock source (SYSCLK3) frequency (see [Section 6.13.3](#), *HPI Electrical Data/Timing*). The external host **must** be aware of the SYSCLK3 frequency during boot to ensure the $\overline{HSTROBE}$ pulse duration timing requirement is met.

3.4.2 Bootmode Registers

3.4.2.1 BOOTCFG Register

The Device Bootmode (see [Section 3.4.1](#), *Boot Modes*) and Configuration pins (see [Section 3.5.1](#), *Device and Peripheral Configurations at Device Reset*) latched at reset are captured in the Device Boot Configuration (BOOTCFG) register which is accessible through the System Module. This is a *read-only* register. The bits show the values latched from the corresponding configuration pins sampled at device reset. For more information on how these pins are sampled at device reset, see [Section 6.5.1.2](#), *Latching Boot and Configuration Pins*. For the corresponding device boot and configuration pins, see [Table 2-5](#), *BOOT Terminal Functions*.

LEGEND: R = Read only; L = pin state latched at reset rising edge; -n = value after reset

Figure 3-3. BOOTCFG Register—0x01C4 0014

Table 3-9. BOOTCFG Register Description

Bit	Field Name	Description
31:20	RESERVED	Reserved. Writes have no effect.
19	FASTBOOT	Fastboot (see Section 3.4.1.1 , FASTBOOT) This field is used by the device bootloader code to determine if it needs to speed up the device to PLL mode before booting. 0 = No Fastboot 1 = Fastboot The default value is latched from FASTBOOT configuration pin.
18:15	RSV	Reserved. Writes have no effect.
14:12	PLLMS	PINMUX0.AEAW default [AEAW] and Fastboot PLL Multiplier Select [PLLMS] (see Section 3.5.1.2 , <i>EMIFA Address Width Select [AEAW] and Fast Boot PLL Multiplier Select [PLLMS]</i>) The AEAW[2:0]/PLLMS configuration pins serve two purposes: AEAW[2:0]: 8-bit EMIFA (Async) Pinout Mode 1 Address Width If AEM = 001, this field serves as AEAW and it indicates the 8-bit EMIFA (Async) Pinout Mode 1 Address Width. In this case, this field affects pin mux control only by setting the default of Pin Mux Control Register PINMUX0.AEAW[2:0]. This field does not affect EMIFA register settings. For more details on the AEAW settings, see Section 3.7.2.1 , <i>PINMUX0 Register Description</i> . PLLMS: Fastboot PLL Multiplier Select If FASTBOOT = 1 and AEM[2:0] = 000b or 101b, this field selects the FASTBOOT PLL Multiplier. In this case, this field <i>does not</i> affect the pin mux control or the EMIFA register settings. The bootloader code uses this field to determine the PLL multiplier used for Fastboot.
11	RSV	Reserved. Writes have no effect.
10:8	DAEM	PINMUX0.AEM default [DAEM] (see Section 3.5.1.1 , <i>EMIFA Pinout Mode (AEM[2:0])</i>) For more details on the AEM settings, see Section 3.7.2.1 , <i>PINMUX0 Register Description</i> . This field affects pin mux control by setting the default of PINMUX0.AEM. This field <i>does not</i> affect EMIFA Register settings. The default value is latched from the AEM[2:0] configuration pins.
7:4	RESERVED	Reserved. Writes have no effect.
3:0	BOOTMODE	Boot Mode (see Section 3.4.1 , <i>Boot Modes</i>) This field is used in conjunction with FASTBOOT, AEM, and PLLMS to determine the device boot mode. The default value is latched from the BOOTMODE[3:0] configuration pins.

3.4.2.2 BOOTCMPLT Register

If the bootloader code detects an error during boot, it records the error status in the Boot Complete (BOOTCMPLT) register.

In addition, the BOOTCMPLT register is used for communication between the external host and the bootloader code during a Host Boot (HPI Boot). Once the external host has completed boot, it *must* perform the following communication with the bootloader code:

- Write the desired 32-bit CPU starting address in the DSPBOOTADDR register (see [Section 3.4.2.3, DSPBOOTADDR Register](#)).
- Write a '1' to the Boot Complete (BC) bit field in the BOOTCMPLT register to indicate that the host has completed booting this device.

Once the bootloader code detects BC = 1, it directs the CPU to begin executing from the DSPBOOTADDR register.

The BOOTCMPLT register is reset by any device-level global reset. For the list of device-level global resets, see [Section 6.5, Reset](#).

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-4. BOOTCMPLT Register— 0x01C4 000C

Table 3-10. BOOTCMPLT Register Description

Bit	Field Name	Description
31:20	RESERVED	Reserved. For proper device operation, the user should <i>only</i> write "0" to these bits.
19:16	ERR	Boot Error 0000 = No Error (default). 0001 - 1111 = bootloader software detected a boot error and aborted the boot. For the error codes, see the <i>Using the TMS320DM643x DMP Bootloader</i> Application Report (literature number SPRAAG0).
15:1	RESERVED	Reserved. For proper device operation, the user should <i>only</i> write "0" to these bits.
0	BC	Boot Complete Flag from Host This field is <i>only</i> applicable to Host Boots. 0 = Host <i>has not</i> completed booting this device (default). 1 = Host <i>has</i> completed booting this device. DSP can begin executing from the DSPBOOTADDR register value.

3.4.2.3 DSPBOOTADDR Register

The DSP Boot Address (DSPBOOTADDR) register contains the starting address for the C64x+ CPU. Whenever the C64x+ is released from reset, it begins executing from the location pointed to by DSPBOOTADDR register. For Host boots (HPI Boot), the DSPBOOTADDR register is also used for communication between the Host and the bootloader code during boot.

The DSPBOOTADDR register is reset by any device-level global reset. For the list of device-level global resets, see [Section 6.5, Reset](#).

Figure 3-5. DSPBOOTADDR Register— 0x01C4 0008

Table 3-11. DSPBOOTADDR Register Description

Bit	Field Name	Description
31:0	DSPBOOTADDR	<p>DSP Boot Address</p> <p>After boot, the C64x+ CPU begins execution from this 32-bit address location. The lower 10 bits (bits 9:0) should <i>always</i> be programmed to "0" as they are ignored by the C64x+. The default value of the DSPBOOTADDR depends on the boot mode selected.</p> <p>The DSPBOOTADDR defaults to 0x00100000 when the Internal Bootloader ROM is used. <i>or</i> The DSPBOOTADDR defaults to 0x42000000 when EMIFA $\overline{CS2}$ Space is used.</p> <p>For the boot mode selections, see Table 3-5, Non-Fastboot Modes; Table 3-6, Fixed-Multiplier Fastboot Modes; and Table 3-7, User-Select Multiplier Fastboot Modes.</p>

For Non-Host Boot Modes, software can leave the DSPBOOTADDR register at default.

For Host Boots (HPI Boot), the DSPBOOTADDR register is also used for communication between the Host and the bootloader code during boot. For Host Boots, the DSPBOOTADDR register defaults to Internal Bootloader ROM, and the C64x+ CPU is immediately released from reset so that it can begin executing the bootloader code in this internal ROM. The bootloader code waits for the Host to boot the device. Once the Host is done booting the device, it **must** write a new starting address into the DSPBOOTADDR register, and follow with writing BOOTCMPLT.BC = 1 to indicate the boot is complete. As soon as the bootloader code detects BOOTCMPLT.BC = 1, it instructs the CPU to jump to this new DSPBOOTADDR address. At this point, the CPU continues the rest of the code execution starting from the new DSPBOOTADDR location and the boot is completed.

3.5 Configurations At Reset

Some device configurations are determined at reset. The following subsections give more details.

3.5.1 Device and Peripheral Configurations at Device Reset

Table 2-5, BOOT Terminal Functions lists the device boot and configuration pins that are latched at device reset for configuring basic device settings for proper device operation. Table 3-12, summarizes the device boot and configuration pins, and the device functions that they affect.

Table 3-12. Default Functions Affected by Device Boot and Configuration Pins

DEVICE BOOT AND CONFIGURATION PINS ⁽¹⁾	BOOT SELECTED	PIN MUX CONTROL	GLOBAL SETTING	PERIPHERAL SETTING
BOOTMODE[3:0]	Boot Mode	PINMUX0/PINMUX1 Registers: Based on BOOTMODE[3:0], the bootloader code programs PINMUX0 and PINMUX1 registers to select the appropriate pin functions required for boot.	I/O Pin Power: Based on BOOTMODE[3:0], the bootloader code programs VDD3P3V_PWDN register to power up the I/O pins required for boot.	PSC/Peripherals: Based on BOOTMODE[3:0], the bootloader code programs the PSC to put boot-related peripheral(s) in the Enable State, and programs the peripheral(s) for boot operation.
FASTBOOT	Fastboot	–	Sets Device Frequency: Based on BOOTMODE, FASTBOOT, PLLMS, and AEM the bootloader code programs PLLC1.	–
AEAW[2:0]/PLLMS[2:0]	If FASTBOOT = 1 and AEM = 000b or 101b the PLLMS[2:0] selects the FASTBOOT PLL Multiplier.	PINMUX0.AEAW: AEAW[2:0] sets the default of this field to control the EMIFA address bus width (<i>only applicable if</i> PINMUX0.AEM = 001b). Affects the pin muxing in EMIFA/VPSS Sub-Block 0.	Sets Device Frequency: Based on BOOTMODE, FASTBOOT, PLLMS, and AEM the bootloader code programs PLLC1.	–
AEM[2:0]	Together with FASTBOOT and PLLMS[2:0], determines the FASTBOOT PLL Multiplier.	PINMUX0.AEM: Sets the default of this field to control the EMIFA Pinout Mode. Affects the pin muxing in EMIFA/VPSS Sub-Block 0, 1, and 3.	Sets Device Frequency: Based on BOOTMODE, FASTBOOT, PLLMS, and AEM the bootloader code programs PLLC1.	PSC/EMIFA: The EMIFA module state defaults to SwRstDisable if AEM = 0; otherwise, the EMIFA module state defaults to Enable.

(1) Software can modify all PINMUX0 and PINMUX1 bit fields from their defaults.

For proper device operation, external pullup/pulldown resistors may be required on these device boot and configuration pins. For discussion situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.

Note: All DM6435 configuration inputs (BOOTMODE[3:0], FASTBOOT, AEAW[2:0]/PLLMS[2:0] and AEM[2:0]) are multiplexed with other functional pins. These pins function as device boot and configuration pins only during device reset. The user **must** take care of any potential data contention in the system. To help avoid system data contention, the DM6435 puts these configuration pins into a high-impedance state (Hi-Z) when device reset ($\overline{\text{RESET}}$ or $\overline{\text{POR}}$) is asserted, and continues to hold them in a high-impedance state until the internal global reset is removed; at which point, the default peripheral (either GPIO or EMIFA based on default of AEM[2:0]) will now control these pins.

All of the device boot and configuration pin settings are captured in the corresponding bit fields in the BOOTCFG register (see Section 3.4.2.1).

The following subsections provide more details on the device configurations determined at device reset: AEM and AEAW/PLLMS.

3.5.1.1 EMIFA Pinout Mode (AEM[2:0])

To support different usage scenarios, the DM6435 provides intricate pin multiplexing between the EMIFA and other peripherals. The PINMUX0.AEM register bit field in the System Module determines the EMIFA Pinout Mode. The AEM[2:0] pins only select the default EMIFA Pinout Mode. It is latched at device reset de-assertion (high) into the BOOTCFG.DAEM bit field. The AEM[2:0] value also sets the default of the PINMUX0.AEM bit field. While the BOOTCFG.DAEM bit field shows the actual latched value and *cannot* be modified, the PINMUX0.AEM value can be changed by software to modify the EMIFA Pinout Mode.

Note: The AEM[2:0] value *does not* affect the operation of the EMIFA module itself. It *only* affects which EMIFA pins are brought out to the device pins. For more details on the AEM settings, see [Section 3.7, Multiplexed Pin Configurations](#).

In addition, for Fastboot modes (FASTBOOT = 1), the bootloader code determines the PLL1 multiplier based on the default settings of AEM[2:0] and PLLMS[2:0]. For more details, see [Section 3.4.1.1, Fastboot](#), and [Section 3.5.1.2, EMIFA Address Width Select \(AEAW\) and FASTBOOT PLL Multiplier Select \(PLLMS\)](#).

3.5.1.2 EMIFA Address Width Select (AEAW) and FASTBOOT PLL Multiplier Select (PLLMS)

The AEAW[2:0]/PLLMS[2:0] pins serve two functional purposes (AEAW or PLLMS), depending on the FASTBOOT and AEM settings. The AEAW[2:0]/PLLMS[2:0] pins are latched at device reset de-assertion (high) and captured in the BOOTCFG.PLLMS bit field. This value also sets the default of the PINMUX0.AEAW field.

While the BOOTCFG.PLLMS field shows the actual latched value and *cannot* be modified, the PINMUX0.AEAW value *can* be changed by software to modify the EMIFA pinout.

AEAW as EMIFA Address Width Select (AEAW)

If AEM[2:0] = 001b [8-bit EMIFA (Async) Pinout Mode 1], the AEAW[2:0]/PLLMS[2:0] pins serve as AEAW to set the default of the EMIFA Address Width Selection.

When EMIFA is used in the 8-bit EMIFA (Async) Pinout Mode 1 (PINMUX0.AEM = 001b), the user has the option to determine how many address pins are needed. The unused address pins can be used as general-purpose input/output (GPIO) pins or extra data pins for VPFE. For more details on how the AEAW settings control the exact pin out when AEM = 001b, see [Section 3.7.3.11, EMIFA/VPSS Block Muxing](#). For other EMIFA Pinout Modes (AEM not 001b), AEAW is *not* applicable in determining the EMIFA address width.

Note: AEAW[2:0] value *does not* affect the operation of the EMIFA module itself. It *only* affects which of the EMIFA address bits are brought out to the device pins.

AEAW as Fast Boot PLL Multiplier Select (PLLMS)

If FASTBOOT = 1, and AEM[2:0] = 000b [No EMIFA] or 101b [8-bit EMIFA (NAND) Pinout Mode 5], the AEAW[2:0]/PLLMS[2:0] pins serve as PLLMS to select PLL multiplier for Fastboot modes.

For more information on boot modes and the FASTBOOT PLL multiplier selection, see [Section 3.4.1, Boot Modes](#).

3.6 Configurations After Reset

The following sections provide details on configuring the device after reset.

Multiplexed pins are configured both at and after reset. [Section 3.5.1, Device and Peripheral Configurations at Device Reset](#), discusses multiplexed pin control at reset. For more details on multiplexed pins control after reset, see [Section 3.7, Multiplexed Pin Configurations](#).

3.6.1 Switch Central Resource (SCR) Bus Priorities

Prioritization within the Switched Central Resource (SCR) is programmable for each master. The register bit fields and default priority levels for DM6435 bus masters are shown in [Table 3-13, DM6435 Default Bus Master Priorities](#). The priority levels should be tuned to obtain the best system performance for a particular application. Lower values indicate higher priority. For most masters, their priority values are programmed at the system level by configuring the MSTPRI0 and MSTPRI1 registers. Details on the MSTPRI0/1 registers are shown in [Figure 3-6](#) and [Figure 3-7](#). The C64x+, VPSS, and EDMA masters contain registers that control their own priority values.

Table 3-13. DM6435 Default Bus Master Priorities

Priority Bit Field	Bus Master	Default Priority Level
VPSSP	VPSS	0 (VPSS PCR Register)
EDMATC0P	EDMATC0	0 (EDMACC QUEPRI Register)
EDMATC1P	EDMATC1	0 (EDMACC QUEPRI Register)
EDMATC2P	EDMATC2	0 (EDMACC QUEPRI Register)
C64X+_DMAP	C64X+ (DMA)	7 (C64x + MDMAARBE.PRI field)
C64X+_CFGP	C64X+ (CFG)	1 (MSTPRI0 Register)
EMACP	EMAC	4 (MSTPRI1 Register)
VLYNQP	VLYNQ	4 (MSTPRI1 Register)

Table 3-15. MSTPRI1 Register Description

Bit	Field Name	Description
31:27	RESERVED	Reserved. Read-only, writes have no effect.
26:24	RSV	Reserved. For proper device operation, the user must only write "100" to these bits.
23	RSV	Reserved. Read-only, writes have no effect.
22:20	HPIP	HPI master port priority in System Infrastructure. 000 = Priority 0 (Highest) 100 = Priority 4 001 = Priority 1 101 = Priority 5 010 = Priority 2 110 = Priority 6 011 = Priority 3 111 = Priority 7 (Lowest)
19	RSV	Reserved. Read-only, writes have no effect.
18:16	VLYNQP	VLYNQ master port priority in System Infrastructure. 000 = Priority 0 (Highest) 100 = Priority 4 001 = Priority 1 101 = Priority 5 010 = Priority 2 110 = Priority 6 011 = Priority 3 111 = Priority 7 (Lowest)
15:3	RESERVED	Reserved. Read-only, writes have no effect.
2:0	EMACP	EMAC master port priority in System Infrastructure. 000 = Priority 0 (Highest) 100 = Priority 4 001 = Priority 1 101 = Priority 5 010 = Priority 2 110 = Priority 6 011 = Priority 3 111 = Priority 7 (Lowest)

3.6.2 Peripheral Selection After Device Reset

After device reset, most peripheral configurations are done within the peripheral’s registers. This section discusses some additional peripheral controls in the System Module. For information on multiplexed pin controls that determine what peripheral pins are brought out to the pins, see [Section 3.7, Multiplexed Pin Configurations](#).

3.6.2.1 HPI Control Register (HPICTL)

The HPI Control (HPICTL) register determines the Host Burst Write Time-Out value. **The user should only modify this register once during device initialization. When modifying this register, the user must ensure the HPI FIFOs are empty and there are no on-going HPI transactions.**

Figure 3-8. HPICTL Register— 0x01C4 0030

Table 3-16. HPICTL Register Description

Bit	Field Name	Description
31:10	RESERVED	Reserved. Read-only, writes have no effect.
9:8	RESERVED	Reserved. For proper device operation, the user should <i>only</i> write "0" to these bits (default).
7:0	TIMOUT	Host Burst Write Timeout Value When the HPI time-out counter reaches the value programmed here, the HPI write FIFO content is flushed. For more details on the time-out counter and its use in write bursting, see the <i>TMS320DM643x DMP Host Port Interface (HPI) User’s Guide</i> (literature number SPRU998).

3.6.2.2 Timer Control Register (TIMERCTL)

The Timer Control Register (TIMERCTL) provides additional control for Timer0 and Timer2. **The user should only modify this register once during device initialization, when the corresponding Timer is not in use.**

- Timer 2 Control: The TIMERCTL.WDRST bit determines if the WatchDog timer event (Timer 2) can cause a device max reset. For more details on the description of a maximum reset, see [Section 6.5.3, Maximum Reset](#).
- Timer 0 Control: The TINP0SEL bit selects the clock source connected to Timer0’s TIN0 input.

Figure 3-9. TIMERCTL Register— 0x01C4 0084

Table 3-17. TIMERCTL Register Description

Bit	Field Name	Description
31:2	RESERVED	Reserved. Read-Only, writes have no effect.
1	TINP0SEL	Timer0 External Input (TIN0) Select 0 = Timer0 external input comes directly from the TINP0L pin (default). 1 = Timer0 external input is TINP0L pin divided by 6. For example, if TINP0L = 27MHz, Timer0 input TIN0 is 27MHz / 6 = 4.5 MHz.
0	WDRST	WatchDog Reset Enable 0 = WatchDog Timer Event (WDINT from Timer2) does not cause device reset. 1 = WatchDog Timer Event (WDINT from Timer2) causes a device max reset (default).

3.6.2.3 EDMA TC Configuration Register (EDMATCCFG)

The EDMA Transfer Controller Configuration (EDMATCCFG) register configures the default burst size (DBS) for EDMA TC0, EDMA TC1, and EDMA TC2. For more information on the correct usage of DBS, see the *TMS320DM643x DMP Enhanced Direct Memory Access (EDMA) Controller User's Guide* (literature number [SPRU987](#)). **The user should only modify this register once during device initialization and when the corresponding EDMA TC is not in use.**

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-10. EDMATCCFG Register— 0x01C4 0088

Table 3-18. EDMATCCFG Register Description

Bit	Field	Description
31:6	RESERVED	Reserved. Read-Only, writes have no effect.
5:4	TC2DBS	EDMA TC2 Default Burst Size 00 = 16 byte 01 = 32 byte 10 = 64 byte (default) 11 = reserved EDMA TC2 is intended for miscellaneous transfers. TC2 FIFO size is 128 bytes, regardless of Default Burst Size setting.
3:2	TC1DBS	EDMA TC1 Default Burst Size 00 = 16 byte 01 = 32 byte (default) 10 = 64 byte 11 = reserved EDMA TC1 is intended for high throughput bulk transfers. TC1 FIFO size is 256 bytes, regardless of Default Burst Size setting.
1:0	TC0DBS	EDMA TC0 Default Burst Size 00 = 16 byte (default) 01 = 32 byte 10 = 64 byte 11 = reserved EDMA TC0 is intended for short burst transfers with stringent deadlines (e.g., McBSP, McASP). TC0 FIFO size is 128 bytes, regardless of Default Burst Size setting.

3.7 Multiplexed Pin Configurations

DM6435 makes extensive use of pin multiplexing to accommodate a large number of peripheral functions in the smallest possible package, providing ultimate flexibility for end applications.

The Pin Multiplex Registers PINMUX0 and PINMUX1 in the System Module are responsible for controlling all pin multiplexing functions on the DM6435. The default setting of some of the PINMUX0 and PINMUX1 bit fields are configured by configuration pins latched at reset (see [Section 3.5.1, Device and Peripheral Configurations at Device Reset](#)). After reset, software may program the PINMUX0 and PINMUX1 registers to switch pin functionalities.

The following peripherals have multiplexed pins: VPSS (VPFE), EMIFA, HPI, VLYNQ, EMAC, McASP0, McBSP0, PWM0, PWM1, PWM2, Timer0, Timer1, UART0, UART1, HECC, and GPIO.

The device is divided into the following Pin Multiplexed Blocks (Pin Mux Blocks):

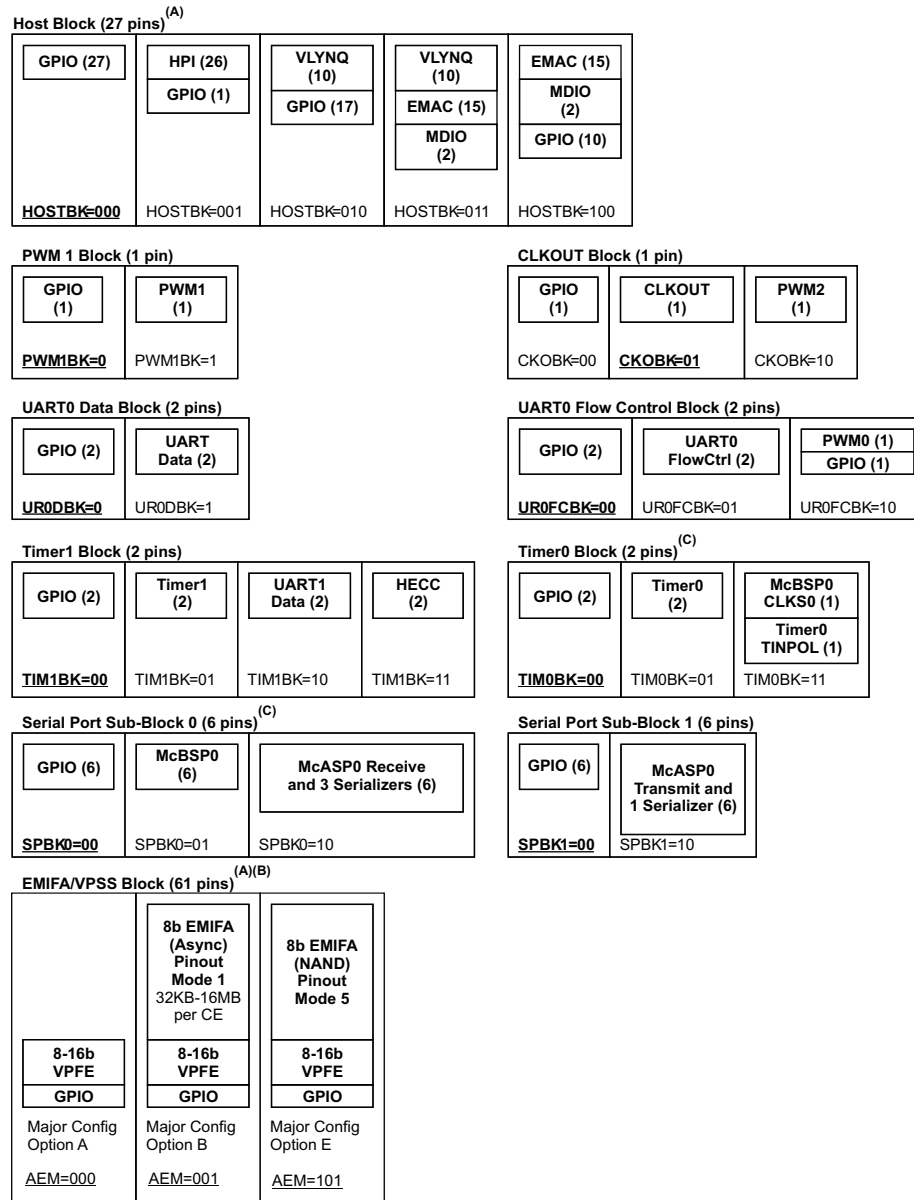

- **EMIFA/VPSS Block:** VPSS (VPFE), EMIFA, and GPIO. This block is further subdivided into these sub-blocks:
 - **Sub-Block 0:** VPFE (CCDC), part of EMIFA (address and control), and GPIO
 - **Sub-Block 1:** part of EMIFA (data, address, control), and GPIO
 - **Sub-Block 2:** part of EMIFA (control signals EM_WAIT/(RDY/BSY), $\overline{\text{EM_OE}}$, and $\overline{\text{EM_WE}}$)
 - **Sub-Block 3:** part of EMIFA (address EM_A[12:5]), and GPIO
- **Host Block:** HPI, VLYNQ, EMAC, and GPIO
- **Serial Port Block:** McBSP0, McASP0, and GPIO. This block is further sub-divided into sub-blocks.
 - **Serial Port Sub-Block 0:** McBSP0, part of McASP0, and GPIO
 - **Serial Port Sub-Block 1:** part of McASP0 and GPIO
- **UART0 Flow Control Block:** UART0 flow control, PWM0, and GPIO
- **UART0 Data Block:** UART0 data and GPIO
- **Timer0 Block:** Timer0 and McBSP0 CLKS pins
- **Timer1 Block:** Timer1 and HECC, UART1 data
- **PWM1 Block:** PWM1 and GPIO
- **CLKOUT Block:** CLKOUT0, PWM2, and GPIO

As shown in the list above, the McBSP0 and UART0 peripherals span multiple Pin Mux Blocks. To use these peripherals, they must be selected in all relevant Pin Mux Blocks. For more details, see [Section 3.7.3, Pin Multiplexing Details](#), and [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#).

Note: there is no actual pin multiplexing in EMIFA/VPSS Sub-Block 2. However this is still considered a "pin mux block" because it contains part of the pins necessary for EMIFA.

A high level view of the Pin Mux Blocks is shown in [Figure 3-11](#). In each Pin Mux Block, the PINMUX0/PINMUX1 default settings are underlined.

Note: some default pin functions are determined by configuration pins (AEAW[2:0] and AEM[2:0]); therefore, more than one configuration setting can serve as default based on the configuration pin settings latched at device reset.

- A. Default settings for PINMUX0 and PINMUX1 registers are underlined.
- B. EMIFA/VPSS Block: shows the Major Config Options based on the AEM settings. Actual pin functions in the EMIFA/VPSS Block are further determined by other PINMUX fields.
- C. McBSP0 pins span multiple blocks (Serial Port Sub-Block0 and Timer0 Block). Serial Port Sub-Block0 contains most of the pins needed for McBSP0 operation. Timer0 Block contains the optional external clock source input CLKS0.

Figure 3-11. Pin Mux Block Selection

3.7.1 Pin Muxing Selection At Reset

This section summarizes pin mux selection at reset.

The configuration pins AEM[2:0] and AEAW[2:0] latched at device reset determine default pin muxing for the following Pin Mux Blocks:

- EMIFA/VPSS Block: default pin mux determined by AEM[2:0] and AEAW[2:0]. **After reset, software may modify settings in the PINMUX0 register to add VPFE functionalities into this block.**
 - AEM[2:0] = 000b, AEAW[2:0] = don't care: Major Config Option A is selected. This block defaults to 61 GPIO pins.
 - AEM[2:0] = 001b, AEAW[2:0] = 000b to 100b: Major Config Option B is selected. This block defaults to 8-bit EMIFA (Async) Pinout Mode 1, plus 24-to-32 GPIO pins.
 - AEM[2:0] = 101b, AEAW[2:0] = don't care: Major Config Option E is selected. This block defaults to 8-bit EMIFA (NAND) Pinout mode 5, plus 47 GPIO pins.

For a description of the PINMUX0 and PINMUX1 registers and more details on pin muxing, see [Section 3.7.2, Pin Muxing Selection After Reset](#).

3.7.2 Pin Muxing Selection After Reset

The PINMUX0 and PINMUX1 registers in the System Module allow software to select the pin functions in the Pin Mux Blocks. The pin control of some of the Pin Mux Blocks requires a combination of PINMUX0/PINMUX1 bit fields. For more details on the combination of the PINMUX bit fields that control each muxed pin, see [Section 3.7.3.1, Multiplexed Pins on DM6435](#).

This section only provides an overview of the PINMUX0 and PINMUX1 registers. For more detailed discussion on how to program each Pin Mux Block, see [Section 3.7.3, Pin Multiplexing Details](#).

3.7.2.1 PINMUX0 Register Description

The Pin Multiplexing 0 Register (PINMUX0) controls the pin function in the EMIFA/VPSS Block. The PINMUX0 register format is shown in [Figure 3-12](#) and the bit field descriptions are given in [Table 3-19](#). Some muxed pins are controlled by more than one PINMUX bit field. For the combination of the PINMUX bit fields that control each muxed pin, see [Section 3.7.3.1, Multiplexed Pins on DM6435](#). For more information on EMIFA/VPSS Block pin muxing, see [Section 3.7.3.11, EMIFA/VPSS Block Muxing](#). For the pin-by-pin muxing control of the EMIFA/VPSS Block, see [Section 3.7.3.11.7, EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary](#).

Figure 3-12. PINMUX0 Register— 0x01C4 0000 (1)

Table 3-19. PINMUX0 Register Description

Bit	Field Name	Description	Pins Controlled
31	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	
30	CI10SEL	CI[1:0] Function Select. 0 = No CCDC CI[1:0]. Pins function as GPIO or EMIFA based on AEM and AEA settings (default). 1 = Selects CCDC [1:0] (as CCD8 and CCD9, respectively) to get at least a 10-bit CCDC. To use the 10-bit CCDC, the user must also configure PINMUX0.CCDCSEL = 1.	Sub-Block 0 CI1(CCD9)/EM_A[19]/GP[45] CI0(CCD8)/EM_A[20]/GP[44] The combination of PINMUX0 fields AEM, AEA, and CI10SEL bits control the pin muxing of these 2 pins. ⁽¹⁾
29	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	
28	CI32SEL	CI[3:2] Function Select. 0 = No CCDC CI[3:2]. Pins function as GPIO or EMIFA based on AEM and AEA settings (default). 1 = Selects CCDC [3:2] (as CCD10 and CCD11, respectively) to get at least a 12-bit CCDC. To use the 12-bit CCDC, the user must also configure PINMUX0.CCDCSEL = 1 and PINMUX0.CI10SEL = 1.	Sub-Block 0 CI3(CCD11)/EM_A[17]/GP[47] CI2(CCD10)/EM_A[18]/GP[46] The combination of PINMUX0 fields AEM, AEA, and CI32SEL bits control the pin muxing of these 2 pins. ⁽¹⁾
27	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	
26	CI54SEL	CI[5:4] Function Select. 0 = No CCDC CI[5:4]. Pins function as GPIO or EMIFA based on AEM and AEA settings (default). 1 = Selects CCDC [5:4] (as CCD12 and CCD13, respectively) to get at least a 14-bit CCDC. To use the 14-bit CCDC, the user must also configure PINMUX0.CCDCSEL = 1, PINMUX0.CI10SEL = 1, and PINMUX0.CI32SEL = 1.	Sub-Block 0 CI5(CCD13)/EM_A[15]/GP[49] CI4(CCD12)/EM_A[16]/GP[48] The combination of PINMUX0 fields AEM, AEA, and CI54SEL bits control the pin muxing of these 2 pins. ⁽¹⁾
25	CI76SEL	CI[7:6] Function Select. 0 = No CCDC CI[7:6]. Pins function as GPIO or EMIFA based on AEM and AEA settings (default). 1 = Selects CCDC [7:6] (as CCD14 and CCD15, respectively) to get at least a 16-bit CCDC. To use the 16-bit CCDC, the user must also configure PINMUX0.CCDCSEL = 1, PINMUX0.CI10SEL = 1, PINMUX0.CI32SEL = 1, and PINMUX0.CI54SEL = 1.	Sub-Block 0 CI7(CCD15)/EM_A[13]/GP[51] CI6(CCD14)/EM_A[14]/GP[50] The combination of PINMUX0 fields AEM, AEA, and CI76SEL bits control the pin muxing of these 2 pins. ⁽¹⁾
24	CFLDSEL	CCDC Field Select. 0 = No CCDC Field (C_FIELD). Pin functions as EMIFA EM_A[21] or GPIO based on AEM setting (default). 1 = CCDC Field (C_FIELD).	Sub-Block 0 C_FIELD/EM_A[21]/GP[34] The combination of PINMUX0/1 fields CFLDSEL and AEM control the muxing of this pin. ⁽¹⁾
23	CWENSEL	CCDC Write Enable Select. 0 = No CCDC Write Enable. Pin functions as EMIFA EM_R/ \overline{W} or GPIO based on AEM setting (default). 1 = CCDC Write Enable (C_WE). Pin functions as CCDC Write Enable C_WE. Applicable <i>only</i> for AEM = 0 (000b) or 5 (101b).	Sub-Block 0 C_WE/EM_R/ \overline{W} /GP[35] The combination of PINMUX0 fields CWENSEL and AEM control the muxing of this pin. ⁽¹⁾
22	HVDSEL	CCDC HD and VD Select. 0 = No CCDC HD and VD. Pins function as GPIO (GP[53] and GP[52]) (default). 1 = CCDC HD and VD.	Sub-Block 0 VD/GP[53] HD/GP[52] The PINMUX0 field HVDSEL alone controls the muxing of these 2 pins.
21	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	

(1) For the full set of valid configurations of these pins, see [Section 3.7.3.11.7, EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary](#).

Table 3-19. PINMUX0 Register Description (continued)

Bit	Field Name	Description	Pins Controlled
20	CCDCSEL	<p>CCDC Select. This bit field determines if CCDC is supported or not.</p> <p>0 = CCDC <i>not</i> supported. Pins function as GPIO (GP[54] and GP[43:36]) (default).</p> <p>1 = CCDC supported. Pins function as CCDC PCLK, YI[7:0].</p>	<p>Sub-Block 0</p> <p>PCLK/GP[54] Y17(CCD7)/GP[43] Y16(CCD6)/GP[42] Y15(CCD5)/GP[41] Y14(CCD4)/GP[40] Y13(CCD3)/GP[39] Y12(CCD2)/GP[38] Y11(CCD1)/GP[37] Y10(CCD0)/GP[36]</p> <p>The PINMUX0 field CCDCSEL alone controls the muxing of these 9 pins.</p>
19	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	
18:16	AEAW ⁽¹⁾	<p>8-bit EMIFA (Async) Pinout Mode 1 Address Width Select or Fast Boot PLL Multiplier Select This field serves two purposes:</p> <ol style="list-style-type: none"> If AEM = 001b, this field serves as the 8-bit EMIFA (Async) Pinout Mode 1 Address Width Select. If FASTBOOT = 1 and AEM = 0 (000b) or 5 (101b), this field serves as the <i>Fastboot PLL Multiplier Select</i>. <p>Fastboot PLL Multiplier Select: For more details on the AEAW pin functions as Fastboot PLL Multiplier Select, see Section 3.4.1, Bootmodes.</p> <p>EMIFA Address Width Select:</p> <p>000b = EMIFA (Async) pinout supports <i>only</i> EM_A[12:0] address pins. EMIFA (Async) signals EM_A[20:13] are not pinned out. PINMUX bit fields CI76SEL, CI54SEL, CI32SEL, and CI10SEL determine the function of these 8 pins.</p> <p>001b = EMIFA (Async) pinout supports <i>only</i> EM_A[14:0] address pins. EMIFA (Async) signals EM_A[14:13] are pinned out. PINMUX0 bit field CI76SEL must be programmed to 0. EMIFA (Async) signals EM_A[20:15] are not pinned out. PINMUX0 bit fields CI54SEL, CI32SEL, and CI10SEL determine the function of these 6 pins.</p> <p>010b = EMIFA (Async) pinout supports <i>only</i> address pins EM_A[16:0]. EMIFA (Async) signals EM_A[16:13] are pinned out. PINMUX0 bit fields CI76SEL and CI54SEL must be programmed to 0. EMIFA (Async) signals EM_A[20:17] are not pinned out. PINMUX0 bit fields CI32SEL and CI10SEL determine the function of these 4 pins.</p> <p>011b = EMIFA (Async) pinout supports <i>only</i> address pins EM_A[18:0]. EMIFA (Async) signals EM_A[18:13] are pinned out. PINMUX0 bit fields CI76SEL, CI54SEL, and CI32SEL must be programmed to 0. EMIFA (Async) signals EM_A[20:19] are not pinned out. PINMUX0 bit field CI10SEL determines the function of these 2 pins.</p> <p>100b = EMIFA (Async) pinout supports address pins EM_A[20:0]. EMIFA (Async) signals EM_A[20:13] are pinned out. - (1) The AEM default value is latched at reset from AEM[2:0] configuration inputs. The latched values are also shown at BOOTCFG.DAEM (read-only).
- (2) For the full set of valid configurations of these pins, see Section 3.7.3.11.7, EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary.

3.7.2.2 PINMUX1 Register Description

The Pin Multiplexing 1 Register (PINMUX1) controls the pin multiplexing of all Pin Mux Blocks. The PINMUX1 register format is shown in [Figure 3-13](#) and the bit field descriptions are given in [Table 3-20](#). Some muxed pins are controlled by more than one PINMUX bit field. For the combination of PINMUX bit fields that control each muxed pin, see [Section 3.7.3.1, Multiplexed Pins on DM6435](#).

3:1	RESERVED	Reserved. For proper device operation, the user should only write "0" to this bit (default).	–
0	RSV	Reserved. Writes have no effect.	–

3.7.3 Pin Multiplexing Details

This section discusses how to program each Pin Mux Block to select the desired peripheral functions.

The following steps can be used to determine pin muxing suitable for the application:

1. Understand the major configuration choices available for the specific application.
 - a. Device Major Configuration Choices: [Figure 3-11](#) shown in [Section 3.7, Multiplexed Pin Configurations](#), provides a high-level view of the device pin muxing and can be used to determine the possible mix of peripheral options for a specific application.
 - b. EMIFA/VPSS Block Major Configuration Choices: The EMIFA/VPSS block features extensive pin multiplexing to accommodate a variety of applications. In addition to [Figure 3-11, Section 3.7.3.11, EMIFA/VPSS Block Muxing](#), provides more details on the Major Configuration choices for this block.
2. See [Section 3.7.3.1, Multiplexed Pins on DM6435](#), for a summary of all the multiplexed pins on this device and the pin mux group they belong to.
3. Refer to the individual pin mux sections ([Section 3.7.3.3, Host Block Muxing](#) to [Section 3.7.3.11, EMIFA/VPSS Block Muxing](#)) for pin muxing details for a specific pin mux block.
 - a. For peripherals that span multiple pin mux blocks, the user must select the appropriate pins for that peripheral in all relevant pin mux blocks. For more details, see [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#).

For details on PINMUX0 and PINMUX1 registers, see [Section 3.7.2](#).

3.7.3.1 Multiplexed Pins on DM6435

[Table 3-21](#) summarizes all of the multiplexed pins on DM6435, the pin mux group for each pin, and the PINMUX register fields that control the pin. For pin mux details, see the specific pin mux group section ([Section 3.7.3.3, Host Block Muxing](#) to [Section 3.7.3.11, EMIFA/VPSS Block Muxing](#)). For a description of the PINMUX register fields, see [Section 3.7.2](#).

Table 3-21. Multiplexed Pins on DM6435 (continued)

SIGNAL			PINMUX DESCRIPTION	
NAME	ZWT NO.	ZDU NO.	PINMUX GROUP	CONTROLLED BY PINMUX BIT FIELDS
CLKOUT0/PWM2/GP[84]	M1	R1	CLKOUT Block	CKOBK

Note: PINMUX group EMIFA/VPSS Sub-Block 2 is not shown in the above table because there is no actual pin multiplexing in that block. But this block is still considered a "pin mux block" because it contains some of the pins necessary for EMIFA. The pins in this block are as follows:

- **EMIFA/VPSS Sub-Block 2**
 - $\overline{EM_WAIT}/(RDY/\overline{BSY})$
 - $\overline{EM_OE}$
 - $\overline{EM_WE}$

3.7.3.2 Peripherals Spanning Multiple Pin Mux Blocks

Some peripherals span multiple Pin Mux Blocks. To use these peripherals, they must be selected in all of the relevant Pin Mux Blocks. The following is the list of peripherals that span multiple Pin Mux Blocks:

- **McBSP0:** Six McBSP0 pins are located in the Serial Port Sub-Block 0, but the CLKS0 pin is muxed in the Timer0 Block. To select McBSP0 pins, program PINMUX registers as follows:
 - **Serial Port Sub-Block 0:** SPBK0 = 01
 - **Timer0 Block:** If CLKS0 pin is desired, program TIM0BK = 10 or 11.
- **UART0:** The two UART0 data pins are located in the UART0 Data Block, but the two UART0 flow control pins are located in the UART0 Flow Control Block. To select UART0, program PINMUX registers as follows:
 - **UART0 Data Block:** UR0BK = 1
 - **UART0 Flow Control Block:** If flow control pins are desired, program UR0FCBK = 01.

3.7.3.3 Host Block Muxing

This block of 27 pins consists of HPI, VLYNQ, EMAC, MDIO, and GPIO muxed pins. The following register field selects the pin functions in the Host Block:

- PINMUX1.HOSTBK

[Table 3-22](#) summarizes the 27 pins in the Host Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-22. Host Block Muxed Pins Selection

SIGNAL NAME	MULTIPLEXED FUNCTIONS

HINT/MRXD3/GP[82]	HINT	MRXD3		–	–	GP[82]				
HAS/MDIO/GP[83]	HAS	MDIO		–	–	GP[83]				

Table 3-23 provides a different view of the Host Block pin muxing, showing the Host Block function based on PINMUX1 settings. The selection options are also shown pictorially in Figure 3-11.

If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.

Table 3-23. Host Block Function Selection

PINMUX1 SETTING	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
HOSTBK		
000	GPIO (27) (default)	GPIO: GP[83:57]
001	HPI + GPIO (1)	HPI: HHWIL, HCNTL[1:0], HR \overline{W} , $\overline{HDS2}$, $\overline{HDS1}$, \overline{HRDY} , \overline{HCS} , \overline{HINT} , \overline{HAS} , HD[15:0] GPIO: GP[57]
010	VLYNQ + GPIO (17)	VLYNQ: VLYNQ_CLOCK, VLYNQ_SCRUN, VLYNQ_RXD[3:0], VLYNQ_TXD[3:0] GPIO: GP[83:67]
011	VLYNQ + EMAC (MII) + MDIO	VLYNQ: VLYNQ_CLOCK, VLYNQ_SCRUN, VLYNQ_RXD[3:0], VLYNQ_TXD[3:0] EMAC (MII): TXCLK, CRS, COL, TXD[3:0], RXDV, TXEN, RXER, RXCLK, RXD[3:0] MDIO: MDC, MDIO If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.
100	EMAC (MII) + MDIO + GPIO (10)	EMAC (MII): TXCLK, CRS, COL, TXD[3:0], RXDV, TXEN, RXER, RXCLK, RXD[3:0] MDIO: MDC, MDIO GPIO: GP[66:57] If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.
101 to 111	Reserved	Reserved

The VDD3P3V_PWDN.HOST field determines the power state of the Host Block pins. The Host Block pins default to powered up. For more details on the VDD3P3V_PWDN.HOST field, see Section 3.2, *Power Considerations*.

3.7.3.4 UART0 Data Block Muxing

This block of 2 pins consists of UART0 Data and GPIO muxed pins. The PINMUX1.UR0DBK register field select the pin functions in the UART0 Data Block.

Table 3-24 summarizes the 2 pins in the UART0 Data Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-24. UART0 Data Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS			
	UART0		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT
URXD0/GP[85]	URXD0	UR0DBK = 1	GP[85]	UR0DBK = 0
UTXD0/GP[86]	UTXD0		GP[86]	

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, the UART0 pins span across two Pin Mux Blocks: UART0 Data Block, and UART0 Flow Control Block. For proper UART0 operation, the two pins in the UART0 Data Block must be configured for UART0 data functions. The two pins in the UART0 Flow Control Block are optional.

Table 3-25 provides a different view of the UART0 Data Block pin muxing, showing the UART0 Data Block function based on PINMUX1.UR0DBK setting. The selection options are also shown pictorially in Figure 3-11.

Table 3-25. UART0 Data Block Function Selection

PINMUX1.UR0DBK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
0	GPIO (2) (default)	GPIO: GP[86:85]
1	UART0 Data	UART0: URXD0, UTXD0

In addition, the VDD3P3V_PWDN.UR0DAT field determines the power state of the UART0 Data Block pins. The UART0 Data Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.UR0DAT = 0 to power up the pins. For more details on the VDD3P3V_PWDN.UR0DAT field, see Section 3.2, *Power Considerations*.

The UART0 Data Block features internal pullup resistors, which matches the UART inactive polarity.

3.7.3.5 UART0 Flow Control Block

This block of 2 pins consists of UART0 Flow Control, PWM0, and GPIO muxed pins. The PINMUX1.UR0FCBK register field selects the pin functions in the UART0 Flow Control Block.

Table 3-26 summarizes the 2 pins in the UART0 Flow Control Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-26. UART0 Flow Control Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS					
	UART0		PWM0		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
UCTS0/GP[87]	UCTS0	UR0FCBK = 01	–	–	GP[87]	UR0FCBK = 00/10
URTS0/PWM0/GP[88]	URTS0		PWM0	UR0FCBK = 10	GP[88]	UR0FCBK = 00

As discussed in [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#), the UART0 pins span across two Pin Mux Blocks: UART0 Data Block, and UART0 Flow Control Block. For proper UART0 operation, the two pins in the UART0 Data Block must be configured for UART0 data functions. The two pins in the UART0 Flow Control Block are optional.

[Table 3-27](#) provides a different view of the UART0 Flow Control Block pin muxing, showing the UART0 Flow Control Block function based on PINMUX1.UR0FCBK setting. The selection options are also shown pictorially in [Figure 3-11](#).

Table 3-27. UART0 Flow Control Block Function Selection

PINMUX1.UR0FCBK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (2) (default)	GPIO: GP[88:87]
01	UART0 Flow Control	UART0: UCTS0, URTS0
10	PWM0 + GPIO (1)	PWM0: PWM0 GPIO: GP[87]
11	Reserved	Reserved

In addition, the VDD3P3V_PWDN.UR0FC field determines the power state of the UART0 Flow Control Block pins. The UART0 Flow Control Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.UR0FC = 0 to power up the pins. For more details on the VDD3P3V_PWDN.UR0FC field, see [Section 3.2, Power Considerations](#).

The UART0 Flow Control Block features internal pullup resistors, which matches the UART inactive polarity.

3.7.3.6 Timer0 Block

This block of 2 pins consists of Timer0, McBSP0, and GPIO muxed pins. The PINMUX1.TIM0BK register field selects the pin functions in the Timer0 Block.

[Table 3-28](#) summarizes the 2 pins in the Timer0 Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-28. Timer0 Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS					
	McBSP		Timer0		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
TINPOL/ GP[98]	–	–	TINPOL	TIM0BK = 01/11	GP[98]	TIM0BK = 00
CLKS0/ TOUT0L/ GP[97]	CLKS0	TIM0BK = 11	TOUT0L	TIM0BK = 01	GP[97]	

As discussed in [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#), the McBSP0 pins span across two Pin Mux Blocks: Serial Port Sub-Block0, and Timer0 Block. For proper McBSP0 operation, the Serial Port Sub-Block0 must be programmed to select McBSP0 function. The McBSP0 CLKS0 pin in the Timer0 Block is optional for McBSP0 operation. CLKS0 is only needed if you desire using CLKS0 as an external clock source to the McBSP0 internal sample rate generator.

[Table 3-29](#) provides a different view of the Timer0 Block pin muxing, showing the Timer0 Block function based on PINMUX1.TIM0BK setting. The selection options are also shown pictorially in [Figure 3-11](#).

Table 3-29. Timer0 Block Function Selection

PINMUX1.TIM0BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (2) (default)	GPIO: GP[98:97]
01	Timer0	Timer0: TINP0L, TOUT0L
10	Reserved	–
11	McBSP0 External Clock Source, Timer0 Input	McBSP0: CLKS0 Timer0: TINP0L

In addition, the VDD3P3V_PWDN.TIMER0 field determines the power state of the Timer0 Block pins. The Timer0 Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.TIMER0 = 0 to power up the pins. For more details on the VDD3P3V_PWDN.TIMER0 field, see [Section 3.2, Power Considerations](#).

3.7.3.7 Timer1 Block

This block of 2 pins consists of Timer1, HECC, UART1 Data, and GPIO muxed pins. The PINMUX1.TIM1BK register field selects the pin functions in the Timer1 Block.

[Table 3-30](#) summarizes the 2 pins in the Timer1 Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-30. Timer1 Block Muxed Pins Selection

SIGNAL NAME	MULTIPLEXED FUNCTIONS							
	HECC		TIMER1		UART1		GPIO	
	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
HECC_RX/ TINP1L/ URXD1/ GP[56]	HECC_RX	TIM1BK = 11	TINP1L	TIM1BK = 01	URXD1	TIM1BK = 10	GP[56]	TIM1BK = 00
HECC_TX/ TOUT1L/ UTXD1/ GP[55]	HECC_TX		TOUT1L		UTXD1		GP[55]	

Unlike UART0, UART1 only supports data pins but not flow control pins.

[Table 3-31](#) provides a different view of the Timer1 Block pin muxing, showing the Timer1 Block function based on PINMUX1.TIM1BK setting. The selection options are also shown pictorially in [Figure 3-11](#).

Table 3-31. Timer1 Block Function Selection

PINMUX1.TIM1BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (2) (default)	GPIO: GP[56:55]
01	Timer1	Timer1: TINP1L, TOUT1L
10	UART1 Data	UART1: URXD1, UTXD1
11	HECC	HECC: HECC_RX, HECC_TX

In addition, the VDD3P3V_PWDN.TIMER1 field determines the power state of the Timer1 Block pins. The Timer1 Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.TIMER1 = 0 to power up the pins. For more details on the VDD3P3V_PWDN.TIMER1 field, see [Section 3.2, Power Considerations](#).

The Timer1 Block features internal pull up resistors, which matches the UART and HECC inactive polarity.

3.7.3.8 Serial Port Block

This block of 12 pins consists of McASP0, McBSP0, and GPIO muxed pins. The following register fields select the pin functions in the Serial Port Block:

- PINMUX1.SPBK0
- PINMUX1.SPBK1

The Serial Port Block is further subdivided into these sub-blocks:

- Serial Port Sub-Block 0: McBSP0, part of McASP0, and GPIO.
- Serial Port Sub-Block 1: part of McASP0 and GPIO.

Table 3-32 summarizes the 12 pins in the Serial Port Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-32. Serial Port Block Muxed Pins Selection

SIGNAL NAME	MULTIPLEXED FUNCTIONS					
	McASP0		McBSP0		GPIO	
	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
Serial Port Sub-block 0						
ACLKR0/CLKX0/GP[99]	ACLKR0	SPBK0 = 10	CLKX0	SPBK0 = 01	GP[99]	SPBK0 = 00

AXR0[0]/GP[105]	AXR0[0]	SPBK1 = 10	–	–	GP[105]	SPBK1 = 00
ACLKX0/GP[106]	ACLKX0		–	–	GP[106]	
AFSX0/GP[107]	AFSX0		–	–	GP[107]	
AHCLKX0/GP[108]	AHCLKX0		–	–	GP[108]	
AMUTEIN0/GP[109]	AMUTEIN0		–	–	GP[109]	
AMUTE0/GP[110]	AMUTE0		–	–	GP[110]	

As discussed in Section 3.7.3.2, *Peripherals Spanning Multiple Pin Mux Blocks*, the McBSP0 pins span across two Pin Mux Blocks: Serial Port Sub-Block0, and Timer0 Block. For proper McBSP0 operation, the Serial Port Sub-Block0 must be programmed to select McBSP0 function. The McBSP0 CLKS0 pin in the Timer0 Block is optional for McBSP0 operation. CLKS0 is only needed if you desire using CLKS0 as an external clock source to the McBSP0 internal sample rate generator.

Table 3-33 and Table 3-34 provide a different view of the Serial Port Block. Table 3-33 shows the Serial Port Sub-Block 0 function based on PINMUX1.SPBK0 setting. Table 3-34 shows the Serial Port Sub-Block 1 function based on PINMUX1.SPBK1 setting. These selection options are also shown pictorially in Figure 3-11.

Table 3-33. Serial Port Sub-Block 0 Function Selection

PINMUX1.SPBK0	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (6) (default)	GPIO: GP[104:99]
01	McBSP0	McBSP0: CLKX0, FSX0, DX0, CLKR0, FSR0, DR0
10	McASP0 Receive, 3 Serializers	McASP0: ACLKR0, AFSR0, AHCLKR0, AXR0[3], AXR0[2], AXR0[1]
11	Reserved	Reserved

Table 3-34. Serial Port Sub-Block 1 Function Selection

PINMUX1.SPBK1	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (6) (default)	GPIO: GP[110:105]
01	Reserved	–
10	McASP0 Transmit with 1 Serializer and Mute Control	McASP0: AXR0[0], ACLKX0, AFSX0, AHCLKX0, AMUTEIN0 ⁽¹⁾ , AMUTE0
11	Reserved	–

(1) The input from the AMUTEIN0/GP[109] pin is connected to both the McASP0 and GPIO.

In addition, the VDD3P3V_PWDN.SP field determines the power state of the Serial Port Block pins. The Serial Port Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.SP = 0 to power up the pins. For more details on the VDD3P3V_PWDN.SP field, see Section 3.2, *Power Considerations*.

To facilitate McASP0 operation, the input from the AMUTEIN0/GP[109] pin is connected to both the McASP0 and the GPIO module. Therefore when an external mute event occurs, in addition to notifying the McASP0, it can also cause an interrupt through the GPIO module.

3.7.3.9 PWM1 Block

This block of 1 pin consists of PWM1 and GPIO muxed pins (GP[4]/PWM1). The PINMUX1.PWM1BK register field selects the pin function in the PWM1 Block.

[Table 3-35](#) summarizes the 1 pin in the PWM1 Block, its multiplexed function, and the PINMUX configurations to select the corresponding function.

Table 3-35. PWM1 Block Muxed Pin Selection

SIGNAL	MULTIPLEXED FUNCTIONS			
	PWM1		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT
GP[4]/PWM1	PWM1	PWM1BK = 1	GP[4]	PWM1BK = 0

[Table 3-36](#) provides a different view of the PWM1 Block pin muxing, showing the PWM1 Block function based on PINMUX1.PWM1BK setting. The selection options are also shown pictorially in [Figure 3-11](#).

Table 3-36. PWM1 Block Function Selection

PINMUX1.PWM1BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
0	GPIO (1) (default)	GPIO: GP[4]
1	PWM1	PWM1: PWM1

In addition, the VDD3P3V_PWDN.PWM1 field determines the power state of the PWM1 Block pin. The PWM1 Block pin defaults to powered down and not operational. To use this pin, user must first program VDD3P3V_PWDN.PWM1 = 0 to power up the pin. For more details on the VDD3P3V_PWDN.PWM1 field, see [Section 3.2, Power Considerations](#).

3.7.3.10 CLKOUT Block

This block of 1 pin consists of CLKOUT, PWM2, and GPIO muxed pin (CLKOUT0/PWM2/GP[84]). The PINMUX1.CKOBK register field selects the pin function in the CLKOUT Block.

[Table 3-37](#) summarizes the 1 pin in the CLKOUT Block, its multiplexed function, and the PINMUX configurations to select the corresponding function.

Table 3-37. CLKOUT Block Multiplexed Pin Selection

SIGNAL	MULTIPLEXED FUNCTIONS					
	CLKOUT0		PWM2		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
CLKOUT0/ PWM2/ GP[84]	CLKOUT0	CKOBK = 01	PWM2	CKOBK = 10	GP[84]	CKOBK = 00

[Table 3-38](#) provides a different view of the CLKOUT Block pin muxing, showing the CLKOUT Block function based on PINMUX1.CKOBK setting. The selection options are also shown pictorially in [Figure 3-11](#).

Table 3-38. CLKOUT Block Function Selection

PINMUX1.CKOBK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (1)	GPIO: GP[84]
01	CLKOUT (default)	Device Clock-Out: CLKOUT0
10	PWM2	PWM2: PWM2
11	Reserved	Reserved

This block defaults to CLKOUT0 pin function.

In addition, the VDD3P3V_PWDN.CLKOUT field determines the power state of the CLKOUT Block pin. The CLKOUT Block pin defaults to powered up. For more details on the VDD3P3V_PWDN.CLKOUT field, see [Section 3.2, Power Considerations](#).

3.7.3.11 EMIFA/VPSS Block Muxing

This block of 61 pins consists of VPSS, EMIFA, and GPIO muxed pins. The following register fields affect the pin functions in the EMIFA/VPSS Block:

- All PINMUX0 register fields: AEM, CS5SEL, CS4SEL, CS3SEL, AEAW, CCDCSEL, HVDSEL, CWENSEL, CFLDSEL, CI76SEL, CI54SEL, CI32SEL, and CI10SEL

The EMIFA/VPSS Block is divided into multiple sub-blocks for ultimate flexibility in pin multiplexing to accommodate a wide variety of applications:

- Sub-Block 0: multiplexed between VPFE, EMIFA address/control pins, and GPIO.
- Sub-Block 1: multiplexed between EMIFA data/address/control pins, and GPIO.
- Sub-Block 2: no multiplexing. EMIFA control pins EM_WAIT/(RDY/BSY), $\overline{\text{EM_OE}}$, $\overline{\text{EM_WE}}$.
- Sub-Block 3: multiplexed between EMIFA address pins EM_A[12:6] and GPIO.

The EMBK0, EMBK1, EMBK2, EMBK3 fields in the VDD3P3V_PWDN register determine the power state of the EMIFA/VPSS Block pins. The EMIFA/VPSS Block pins default to powered up. For more details on the EMBK0, EMBK1, EMBK2, EMBK3 fields in the VDD3P3V_PWDN register, see [Section 3.2, Power Considerations](#).

To understand pin multiplexing in the EMIFA/VPSS Block, the user should start with [Section 3.7.3.11.1, EMIFA/VPSS Block Pin Selection Procedure](#), which outlines the procedures to select pin functions of this block. [Section 3.7.3.11.7, EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary](#), provides a pin-by-pin multiplexing summary for the EMIFA/VPSS Block. For more information on the PINMUX0 and PINMUX1 registers, see [Section 3.7.2, Pin Muxing Selection After Device Reset](#).

3.7.3.11.1 EMIFA/VPSS Block Pin Selection Procedure

Follow the steps below to perform pin selection for the EMIFA/VPSS Block and its sub-blocks.

1. **Major Configuration Options:** start with [Table 3-39, EMIFA/VPSS Block Major Configuration Choices](#). Based on the peripheral needs, the user should select from the major configuration options in this block: Major Config Options A, B, and E.
2. **Sub-Block 2 and Sub-Block 3 Selection:** After selecting the major configuration option from [Table 3-39, EMIFA/VPSS Block Major Configuration Choices](#), the pin selection for Sub-Block 2 and Sub-Block 3 is complete.
3. **Sub-Block 0 Selection:** Use [Table 3-40](#) through [Table 3-42, EMIFA/VPSS Sub-Block 0 Configuration Choices](#), to refine Sub-Block 0 pin selections.
 - a. Go to the table with the Major Configuration Option chosen in Step 1.
 - b. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
 - c. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields CCDCSEL, HVDSEL, CWENSEL, CFLDSEL, CI10SEL, CI32SEL, CI54SEL, and CI76SEL.
 - d. The *Selection Fields* columns show the settings needed to program the PINMUX0 register.
4. **Sub-Block 1 Selection:** Use [Table 3-43](#) through [Table 3-45, EMIFA/VPSS Sub-Block 1 Configuration Choices](#), to refine Sub-Block 1 pin selection.
 - a. Go to the table with the Major Configuration Option chosen in Step 1.
 - b. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
 - c. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields CS3SEL, CS4SEL, and CS5SEL.
 - d. The *Selection Fields* columns show the settings needed to program the PINMUX0 register.

After following the procedure in this section to determine pin functions for the EMIFA/VPSS Block, the user should refer to [Section 3.7.3.11.7, EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary](#), for pin-multiplexing information on a pin-by-pin basis.

3.7.3.11.2 EMIFA/VPSS Block Major Configuration Choices

Table 3-39 shows the major configuration choices in the EMIFA/VPSS Block. For instructions on how to use the *EMIFA/VPSS Block Major Configuration Choices* table for the EMIFA/VPSS Block and Sub-Blocks, see Section 3.7.3.11.1.

Table 3-39. EMIFA/VPSS Block Major Configuration Choices

MAJOR CONFIG. OPTION	PINMUX SELECTION FIELDS ⁽¹⁾		RESULTING PERIPHERALS/PINS			
	AEM	CCDCSEL	EMIFA	# GP PINS (FROM GP[33:5])	VPFE AND # GP PINS (FROM GP[54:34])	
					CCDCSEL	VPFE & # GP Pins
A	000	0, 1	-	29 GP pins	0 1	No CCDC 21 GP pins 8-to-16-bit CCDC 0-to-12 GP pins
B	001 ⁽²⁾	0, 1	8-bit EMIFA (ASYNC) Pinout Mode 1 with address pins to support 32KB to 16MB per CS.	9-to-13 GP pins	0 1 ⁽²⁾	No CCDC 11-to-19 GP pins 8-to-16-bit CCDC ⁽²⁾ 0-to-10 GP pins
E	101	0, 1	8-bit EMIFA (NAND) Pinout Mode 5	14-to-18 GP pins	0 1	No CCDC 21 GP pins 8-to-16-bit CCDC 0-to-12 GP pins

- (1) For additional pin mux details for each Sub-Block, see Table 3-40 through Table 3-42, *EMIFA/VPSS Sub-Block 0 Configuration Choices*, and Table 3-43 through Table 3-45, *EMIFA/VPSS Sub-Block 1 Configuration Choices*.
- (2) If PINMUX0.AEM = 001, it is not possible to get the C_WE pin for VPFE.

As shown in Table 3-39, the major configuration choices of the EMIFA/VPSS Block are determined by the following PINMUX register fields:

- PINMUX0 register fields AEM and CCDCSEL

Based on the peripheral needs, select from the major configuration options in this block: Major Configuration Options A, B, and E.

The following is an example on how to read Table 3-39. For example, the "PINMUX Selection Fields" columns indicate that Major Configuration Choice B is selected through setting PINMUX0.AEM = 1 and CCDCSEL = 0 or 1 (based on the system's VPFE requirement). The "Resulting Peripherals/Pins" columns indicate that Major Configuration Option B can support the following combination of pin functions:

- Pins for 8-bit EMIFA (Async or NAND) function. The number of address pins supported provide 32KByte to 16MByte address reach per EMIFA Chip Select (CS) space.
- Pins for up to 16-bit VPFE. If 8-to-16-bit VPFE (CCDCSEL = 1) is selected, the user may have 0 to 10 GPIO pins. Exact detail on number of GPIO pins and VPFE control pins is furthered determined by other PINMUX0 settings discussed in the EMIFA/VPSS Sub-Block 0 Configuration Choices.
- 9-to-13 GPIO pins from GP[33:5]. For details on the number of GPIO pins, see Section 3.7.3.11.4, *EMIFA/VPSS Sub-Block 1 Configuration Choices*.

After using Table 3-39 to select the Major Configuration Option for the EMIFA/VPSS Block, proceed to select the detailed pin choices in the EMIFA/VPSS Sub-Blocks.

3.7.3.11.3 EMIFA/VPSS Sub-Block 0 Configuration Choices

Table 3-40 through Table 3-42 show the configuration choices in the EMIFA/VPSS Sub-Block 0. For instructions on how to use the different configuration choices tables for the EMIFA/VPSS Block and Sub-Blocks, see Section 3.7.3.11.1. **Note:** italics in these tables indicate mandatory settings for a given Minor Configuration option.

Before using Table 3-40 through Table 3-42 to configure the details of the EMIFA/VPSS Sub-Block 0, the user should first select a Major Configuration Option for the EMIFA/VPSS Block (see Section 3.7.3.11.2). After determining the Major Configuration Option (A, B, or E), the user can now use Table 3-40 through Table 3-42 to refine Sub-Block 0 pin selections:

1. Go to the table with the Major Configuration Option chosen from Table 3-39.
2. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
3. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields CCDCSEL, HVDSEL, CWENSEL, CFLDSEL, CI10SEL, CI32SEL, CI54SEL, and CI76SEL.
4. The *PINMUX Selection Fields* columns show the settings needed to program the PINMUX0 register.

Table 3-40. EMIFA/VPSS Sub-Block 0 Configuration Choice A⁽¹⁾

(1) Italics indicate mandatory settings for a given Minor Configuration option.

As shown in [Table 3-40](#) through [Table 3-42](#), the configuration choices of the EMIFA/VPSS Sub-Block 0 are determined by the following PINMUX register fields:

- PINMUX0 register fields AEM, AEAW, CCDCSEL, HVDSEL, CWENSEL, CFLDSEL, CI10SEL, CI32SEL, CI54SEL, and CI76SEL.

The following is an example of how to read [Table 3-40](#) through [Table 3-42](#) using Sub-Block 0 Minor Configuration B6 as an example:

- The *PINMUX Selection Fields* columns indicate that Sub-Block 0 Minor Configuration Option B6 is selected through setting, PINMUX0.AEM = 1, PINMUX0.AEAW = 4, CCDCSEL = 1, HVDSEL = 0 or 1 (based on the system's need for VPFE control signals VD and HD), CWENSEL = 0 (mandatory setting), CFLDSEL = 0 or 1 (based on the system's need for VPFE control signal C_FIELD), CI10SEL = 0 (mandatory), CI32SEL = 0 (mandatory), CI54SEL = 0 (mandatory), and CI76SEL = 0 (mandatory).
- The *Resulting Peripherals/Pins* columns show the functional pins resulting from the PINMUX setting. For example, PINMUX0.CCDCSEL = 1 gives the user the PCLK and YI[7:0] pins for the VPFE. PINMUX0.HVDSEL = 1 gives the user VD and HD pins for VPFE, while HVDSEL = 0 gives the user 2 GP pins.

3.7.3.11.4 EMIFA/VPSS Sub-Block 1 Configuration Choices

Table 3-43 through Table 3-45 show the configuration choices in the EMIFA/VPSS Sub-Block 1. For instructions on how to use the different configuration choices tables for the EMIFA/VPSS Block and Sub-Blocks, see Section 3.7.3.11.1, *EMIFA/VPSS Block Pin Selection Procedure*.

Before using Table 3-43 through Table 3-45 to configure the details of the EMIFA/VPSS Sub-Block 1, the user should first select the Major Configuration Option for the EMIFA/VPSS Block (see Section 3.7.3.11.2, *EMIFA/VPSS Block Major Configuration Choices*). After determining the Major Configuration Option (A, B, or E), the user can now use Table 3-43 through Table 3-45 to refine the Sub-Block 1 pin selections.

1. Go to the table with the Major Configuration Option chosen from Table 3-39.
2. Each Major Configuration Option is further divided down into multiple Minor Configuration Options. Select a Minor Configuration Option that best suits the application need.
3. Within the chosen Minor Configuration Option, further refine the detailed pin configurations by selecting the settings of PINMUX0 fields CS3SEL, CS4SEL, and CS5SEL.
4. The *PINMUX Selection Fields* columns give the user the settings needed to program the PINMUX0 register.

Table 3-43. EMIFA/VPSS Sub-Block 1 Configuration Choice A⁽¹⁾

MAJOR CONFIG OPTION	MINOR CONFIG OPTION	PINMUX SELECTION FIELDS		RESULTING PERIPHERALS/PINS	
		AEM	OTHERS	EMIFA	GPIO
A	A1	000	Cfg Summary	No EMIFA	29 GP pins
			<i>CS3SEL = 0</i>	-	0 = GP[33:5]
			<i>CS4SEL = 0</i>		
			<i>CS5SEL = 0</i>		

(1) Italics indicate mandatory settings for a given Minor Configuration option.

Table 3-44. EMIFA/VPSS Sub-Block 1 Configuration Choice B⁽¹⁾

MAJOR CONFIG OPTION	MINOR CONFIG OPTION	PINMUX SELECTION FIELDS		RESULTING PERIPHERALS/PINS	
		AEM	OTHERS	EMIFA	GPIO
B	B1	001	Cfg Summary	8-bit EMIFA (Async) Pinout Mode 1	10-to-13 GP pins
			Basic Pins You Get	<i>EM_D[7:0], EM_CS2, EM_A[4:0], EM_BA[1:0]</i>	0 = GP[31:22]
			CS3SEL = 0,1	1 = $\overline{\text{EM_CS3}}$	0 = GP[13]
			CS4SEL = 0,1	1 = $\overline{\text{EM_CS4}}$	0 = GP[32]
			CS5SEL = 0,1	1 = $\overline{\text{EM_CS5}}$	0 = GP[33]

(1) Italics indicate mandatory setting for a given Minor Configuration option.

Table 3-45. EMIFA/VPSS Sub-Block 1 Configuration Choice E⁽¹⁾

MAJOR CONFIG OPTION	MINOR CONFIG OPTION	PINMUX SELECTION FIELDS		RESULTING PERIPHERALS/PINS	
		AEM	OTHERS	EMIFA	GPIO
E	E1	101	Cfg Summary	8-bit EMIFA (NAND) Pinout Mode 5	15-to-18 GP pins
			Basic Pins You Get	<i>EM_D[7:0], EM_A[2:1], EM_CS2</i>	0 = GP[31:22, 11:10, 7:5]
			CS3SEL = 0,1	1 = $\overline{\text{EM_CS3}}$	0 = GP[13]
			CS4SEL = 0,1	1 = $\overline{\text{EM_CS4}}$	0 = GP[32]
			CS5SEL = 0,1	1 = $\overline{\text{EM_CS5}}$	0 = GP[33]

(1) Italics indicate mandatory setting for a given Minor Configuration option.

The Sub-Block 1 Minor Configuration Options are independent from the Sub-Block 0 Minor Configuration Options. The user can independently select the appropriate Minor Configuration Option for each Sub-Block.

As shown in [Table 3-43](#) through [Table 3-45](#), the configuration choices of the EMIFA/VPSS Sub-Block 1 are determined by the following PINMUX register fields:

- PINMUX0 register fields AEM, CS3SEL, CS4SEL, and CS5SEL.

The following is an example on how to read [Table 3-43](#) through [Table 3-45](#) using Sub-Block 1 Minor Configuration E1 as an example:

- The *PINMUX Selection Fields* columns indicate that Sub-Block 1 Minor Configuration Option E1 is selected through setting PINMUX0 fields to AEM = 5, CS3SEL = 0/1 (based on the desired pin choice), CS4SEL = 0/1 (based on the desired pin choice), and CS5SEL = 0/1 (based on the desired pin choice).
- The *Resulting Peripherals/Pins* columns show the functional pins resulting from the PINMUX setting. For example, you automatically get EMIFA pins EM_D[7:0], EM_A[2:1], and $\overline{\text{EM_CS2}}$ in addition to at least 15 GPIO pins in Minor Config Option E1 (GP[31:22], GP[11:10], and GP[7:5]). If you program CS3SEL = 1, CS4SEL = 0, and CS5SEL = 0, you also get $\overline{\text{EM_CS3}}$, GP[32], and GP[33].

3.7.3.11.5 EMIFA/VPSS Sub-Block 2 Configuration Choices

The 3 pins in the EMIFA/VPSS Sub-Block 2 are standalone (non-multiplexed) pins. They always function as EMIFA control pins EM_WAIT/(RDY/BSY), EM_OE, and $\overline{\text{EM_WE}}$. No pin mux selection is necessary for this Sub-Block.

3.7.3.11.6 EMIFA/VPSS Sub-Block 3 Configuration Choices

The 8 pins in the EMIFA/VPSS Sub-Block 3 are multiplexed between:

- EMIFA Address Pins EM_A[12:5]
- GPIO pins GP[96:89]

The pin functions in the EMIFA/VPSS Sub-Block 3 are determined by the following PINMUX register fields:

- PINMUX0.AEM

Once the Major Configuration Option for the EMIFA/VPSS Block (see [Section 3.7.3.11.2](#), *EMIFA/VPSS Block Major Configuration Choices*) is chosen, no further actions are necessary to refine the EMIFA/VPSS Sub-Block 3 pin selection. For instructions on configuring the EMIFA/VPSS Block, see [Section 3.7.3.11.1](#), *EMIFA/VPSS Block Pin Selection Procedure*.

[Table 3-46](#) summarizes the pin selections in the EMIFA/VPSS Sub-Block 3 based on the PINMUX selections.

Table 3-46. EMIFA/VPSS Sub-Block 3 Configuration Choices

MAJOR CONFIG OPTION	PINMUX SELECTION FIELD	RESULTING PERIPHERALS/PINS	
	AEM	EMIFA	GPIO
A	000	-	GP[96:89]
B	001	EM_A[12:5]	-
E	101	-	GP[96:89]

The following is an example on how to read [Table 3-46](#) using Sub-Block 3 Major Configuration B as an example:

- The *PINMUX Selection Fields* columns indicate that Sub-Block 3 Major Configuration Option B is selected through setting PINMUX0.AEM = 001b.
- The *Resulting Peripherals/Pins* columns show the functional pins resulting from the PINMUX setting. In Major Configuration B, the user gets EMIFA address pins EM_A[12:5] from Sub-Block 3.

3.7.3.11.7 EMIFA/VPSS Block Pin-By-Pin Multiplexing Summary

This section summarizes the EMIFA/VPSS Block muxing on a pin-by-pin basis. It provides an alternative view to pin muxing in the EMIFA/VPSS Block. This section should only be used after following the procedures listed in [Section 3.7.3.11.1](#) to determine the actual EMIFA/VPSS Configuration Option for the application need.

[Table 3-47](#) shows the pin multiplexing control for each pin in the EMIFA/VPSS Sub-Block 0. These are the fields in the PINMUX0 and PINMUX1 registers that control the multiplexing in this sub-block:

- PINMUX0: AEM, AEAW, CWENSEL, CFLDSEL, CI10SEL, CI32SEL, CI54SEL, CI76SEL, CCDCCSEL, and HVDSEL

[Table 3-48](#) shows the pin multiplexing control for each pin in the EMIFA/VPSS Sub-Block 1. These are the fields in the PINMUX0 register that control the multiplexing in this sub-block:

- PINMUX0: AEM, CS5SEL, CS4SEL, and CS3SEL

EMIFA/VPSS Sub-Block 2 is dedicated to EMIFA pins $\overline{\text{EM_WAIT}}/(\text{RDY}/\overline{\text{BSY}})$, $\overline{\text{EM_OE}}$, and $\overline{\text{EM_WE}}$. There is no pin multiplexing in this block. These pins always function as EMIFA control pins.

[Table 3-49](#) shows the pin multiplexing control for each pin in the EMIFA/VPSS Sub-Block 3. These are the fields in the PINMUX0 register that control the multiplexing in this sub-block:

- PINMUX0: AEM

Table 3-47. EMIFA/VPSS Sub-Block 0 Pin-By-Pin Mux Control

3.8 Device Initialization Sequence After Reset

Software should follow this initialization sequence after coming out of device reset.

1. Complete the boot sequence as needed. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).
2. If the device is not already at the desired operating frequency, program the PLL Controllers (PLLC1 and PLLC2) to configure the device frequency. For details on how to program the PLLC, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number [SPRU978](#)).
3. Program PINMUX0 and PINMUX1 registers to select device pin functions. For more details on programming the PINMUX0 and PINMUX1 registers to select device pin functions, see [Section 3.7, Multiplexed Pin Configurations](#).
Note: if EMAC operation is desired, the EMAC **must** be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.
4. Program the VDD3P3V_PWDN register to power up the necessary I/O pins. For more details on programming the VDD3P3V_PWDN register, see [Section 3.2, Power Considerations](#). On DM6435, the user should program VDD3P3V_PWDN bit 13 to 1 to power down the reserved pins RSV17, RSV18, and RSV19.
5. As needed by the application, program the following System Module registers when there are no active transactions on the respective peripherals:
 - a. HPICTL ([Section 3.6.2.1, HPI Control Register](#)): applicable for HPI **only** if a different host burst write timeout value from default is desired.
 - b. TIMERCTL ([Section 3.6.2.2, Timer Control Register](#)): applicable for Timer0 and Watchdog Timer2 **only**.
 - c. EDMATCCFG ([Section 3.6.2.3, EDMA TC Configuration Register](#)): applicable for EDMA **only**. The recommendation is to leave the EDMATCCFG register at its default.
 - d. VPSS_CLKCTL ([Section 3.3.2, VPSS Clocks](#)): applicable for VPSS **only**.
6. Program the Power and Sleep Controller (PSC) to enable the desired peripherals. For details on how to program the PSC, see the *TMS320DM643x DMP DSP Subsystem* Reference Guide (literature number [SPRU978](#)).
7. Program the Switched Central Resource (SCR) bus priorities for the master peripherals ([Section 3.6.1](#)). This **must** be configured when there are no active transactions on the respective peripherals:
 - a. Program the MSTPRI0 and MSTPRI1 registers in the System Module. These registers can be programmed **before or after** the respective peripheral is enabled by the PSC in step 6.
 - b. Program the EDMACC QUEPRI register, the C64x+ MDMAARBE.PRI field, and the VPSS PCR register. These registers can only be programmed **after** the respective peripheral is enabled by the PSC in step 6.
8. Configure the C64x+ Megamodule and the peripherals.
 - a. For details on C64x+ Megamodule configuration, see the *TMS320C64x+ DSP Megamodule* Reference Guide (literature number [SPRU871](#)).

Special considerations: Bootloader disables C64x+ cache—For all boot modes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM (L2CFG.L2MODE = 0h, L1PCFG.L1PMODE = 0h, and L1DCFG.L1DMODE = 0h). If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see [Section 3.4.1, Boot Modes](#). For more information on the bootloader, see the *Using the TMS320DM643x Bootloader* Application Report (literature number [SPRAAG0](#)).

- b. Peripherals configuration: see the respective peripheral user's guide.

Special considerations: DDR2 memory controller—the Peripheral Bus Burst Priority Register (PBBPR) should be programmed to ensure good DDR2 throughput and to prevent command starvation (prevention of certain commands from being processed by the DDR2 memory controller). For more details, see the *TMS320DM643x DMP DDR2 Memory Controller User's Guide* (literature number [SPRU986](#)). A hex value of 0x20 is recommended for the PBBPR PR_OLD_COUNT field to provide a good DSP performance and still allow good utilization by other modules.

3.9 Debugging Considerations

3.9.1 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the DM643x DMP device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The DM643x DMP features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for *external* pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- *Boot and Configuration Pins:* If the pin is both routed out and 3-stated (not driven), an external pullup/pulldown resistor is **strongly recommended**, even if the IPU/IPD matches the desired value/state.
- *Other Input Pins:* If the IPU/IPD *does not* match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.
- *EMIFA Chip Select Outputs:* On DM6435, the EMIFA chip select pins ($\overline{\text{EM_CS2}}$, $\overline{\text{EM_CS3}}$, $\overline{\text{EM_CS4}}$, and $\overline{\text{EM_CS5}}$) feature an internal pulldown (IPD) resistor. If these pins are connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor **must** be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.

For the boot and configuration pins (listed in [Table 2-5, Boot Terminal Functions](#)), if they are both routed out and 3-stated (not driven), it is **strongly recommended** that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device boot and configuration pins. In addition, applying external pullup/pulldown resistors on the boot and configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest V_{IL} level of all inputs connected to the net. For a pullup resistor, this should be above the highest V_{IH} level of all inputs on the net. A reasonable choice would be to target the V_{OL} or V_{OH} levels for the logic family of the limiting device; which, by definition, have margin to the V_{IL} and V_{IH} levels.
- Select a pullup/pulldown resistor with the largest possible value; but, which can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration which sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the DV_{DD} rail.

For most systems, a 1-k Ω resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For most systems, a 20-k Ω resistor can be used to compliment the IPU/IPD on the boot and configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For more detailed information on input current (I_I), and the low-/high-level input voltages (V_{IL} and V_{IH}) for the DM643x DMP, see [Section 5.3, Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature](#).

For the internal pullup/pulldown resistors for all device pins, see the peripheral/system-specific terminal functions table.

4 System Interconnect

On the DM6435 device, the C64x+ Megamodule, the EDMA3 transfer controllers, and the system peripherals are interconnected through a switch fabric architecture (see [Figure 4-1](#)). The switch fabric is composed of multiple switched central resources (SCRs) and multiple bridges. The SCRs establish low-latency connectivity between master peripherals and slave peripherals. Additionally, the SCRs provide priority-based arbitration and facilitate concurrent data movement between master and slave peripherals. Through an SCR, the DSP subsystem can send data to the DDR2 Memory Controller without affecting a data transfer between the EMAC and L2 memory. Bridges are mainly used to perform bus-width conversion as well as bus operating frequency conversion. For example, in [Figure 4-1](#), Bridge 6 performs a frequency conversion between a bus operating at DSP/3 clock rate and a bus operating at DSP/6 clock rate. Furthermore, Bridge 5 performs a bus-width conversion between a 64-bit bus and a 32-bit bus.

The C64x+ Megamodule, the EDMA3 transfer controllers (EDMA3TC[2:0]), and the various system peripherals can be classified into two categories: master peripherals and slave peripherals. Master peripherals are typically capable of initiating read and write transfers in the system and **do not** rely on the EDMA3 or on the CPU to perform transfers to and from them. The system master peripherals include the C64x+ Megamodule, the EDMA3 transfer controllers, VLYNQ, EMAC, HPI, and VPSS. Not all master peripherals may connect to all slave peripherals. The supported connections are designated by 'Y' in [Table 4-1](#).

Table 4-1. System Connection Matrix

MASTER PERIPHERALS/MODULES	SLAVE PERIPHERALS/MODULES			
	C64x+ SDMA	DDR2 MEMORY CONTROLLER	SCR4 ⁽¹⁾	SCR2, SCR6, SCR7, SCR8 ⁽¹⁾
C64x+ MDMA	–	Y	–	Y
VPSS	–	Y	–	–
VLYNQ	Y	Y	Y	Y
EMAC	Y	Y	Y	Y
HPI	Y	Y	Y	Y
EDMA3TC's (EDMA3TC2/TC1/TC0)	Y	Y	Y	Y
C64x+ CFG	–	–	Y	Y

(1) All the peripherals/modules that support a connection to SCR2, SCR4, SCR6, SCR7, and SCR8 have access to all peripherals/modules connected to those respective SCRs.

4.1 System Interconnect Block Diagram

[Figure 4-1](#) displays the DM6435 system interconnect block diagram. The following is a list that helps in the interpretation of this diagram:

- The direction of the arrows indicates either a bus master or bus slave.
- The arrow originates at a bus master and terminates at a bus slave.
- The direction of the arrows **does not** indicate the direction of data flow. Data flow is typically bi-directional for each of the documented bus paths.
- The pattern of each arrow's line indicates the clock rate at which it is operating— i.e., either DSP/3, DSP/6, or MXI/CLKIN clock rate.
- A peripheral may have multiple instances shown in [Figure 4-1](#) for the following reason:
 - The peripheral/module has master port(s) for data transfers, as well as slave port(s) for register access, data access, and/or memory access. Examples of these peripherals are C64x+ Megamodule, EDMA3, VPSS, VLYNQ, HPI, and EMAC.

Figure 4-1. System Interconnect Block Diagram

5 Device Operating Conditions

5.1 Absolute Maximum Ratings Over Operating Temperature Range (Unless Otherwise Noted)⁽¹⁾

Supply voltage ranges:	Core (CV _{DD}) ⁽²⁾	–0.5 V to 1.5 V
	I/O, 3.3V (DV _{DD33}) ⁽²⁾	–0.5 V to 4.2 V
	I/O, 1.8V (DV _{DDR2} , DDR_VDDDLL, PLL_PWR18, MXV _{DD}) ⁽²⁾	–0.5 to 2.5 V
Input voltage ranges:	V _I I/O, 3.3-V pins	–0.5 V to 4.2 V
	V _I I/O, 1.8 V	–0.5 V to 2.5 V
Output voltage ranges:	V _O I/O, 3.3-V pins	–0.5 V to 4.2 V
	V _O I/O, 1.8 V	–0.5 V to 2.5 V
Operating Junction temperature ranges, T _J :	Commercial	0C to 90C
	Automotive (Q or S suffix)	–40C to 125C
Storage temperature range, T _{stg}	(default)	–65C to 150C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS}.

5.2 Recommended Operating Conditions⁽¹⁾

		MIN	NOM	MAX	UNIT	
CV _{DD}	Supply voltage, Core (CV _{DD}) ⁽²⁾	(-7/-6/-5/-4/-L/-Q6/-Q5/-Q4 devices)	1.14	1.2	1.26	V
		(-7/-6/-5/-4/-L/-Q5 devices)	1.0	1.05	1.1	V

- (1) The actual voltage *must* be determined at device power-up, and **not** be changed dynamically during run-time.
- (2) Applies to "tape and reel" part number counterparts as well. For more information, see [Section 2.8, Device and Development-Support Tool Nomenclature](#).
- (3) Oscillator 1.8 V power supply (MXV_{DD}) can be connected to the same 1.8 V power supply as DV_{DDR2}.
- (4) Oscillator ground (MXV_{SS}) must be kept separate from other grounds and connected directly to the crystal load capacitor ground.
- (5) DDR_VREF is expected to equal 0.5DV_{DDR2} of the transmitting device and to track variations in the DV_{DDR2}.
- (6) In the absence of a heat sink or direct thermal attachment on the top of the device, use the following formula to determine the device junction temperature: T_J = T_C + (Power x Psi_{JT}). Power and T_C can be measured by the user. [Section 7.1, Thermal Data for ZWT](#) and [Section 7.1.1, Thermal Data for ZDU](#) provide the junction-to-package top (Psi_{JT}) value based on airflow in the system. In the presence of a heat sink or direct thermal attachment on the top of the device, additional calculations and considerations **must** be taken into account. For more detailed information on thermal considerations, measurements, and calculations, see the *Thermal Considerations for TMS320DM64xx, TMS320DM64x, and TMS320C6000 Devices* Application Report (literature number [SPRAAL9](#)).
- (7) Applications must meet **both** the Operating Junction Temperature and Operating Ambient Temperature requirements. For more detailed information on thermal considerations, measurements, and calculations, see the *Thermal Considerations for TMS320DM64xx, TMS320DM64x, and TMS320C6000 Devices* Application Report (literature number [SPRAAL9](#)).

5.3 Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature (Unless Otherwise Noted)

PARAMETER		TEST CONDITIONS ⁽¹⁾	MIN	TYP	MAX	UNIT

		CV _{DD} = 1.2 V, DSP clock = 600 MHz		524		mA
		CV _{DD} = 1.2 V, DSP clock = 500 MHz		460		mA
		CV _{DD} = 1.2 V, DSP clock = 400 MHz		392		mA
		CV _{DD} = 1.05 V, DSP clock = 560 MHz		442		mA
		CV _{DD} = 1.05 V, DSP clock = 450 MHz		372		mA
		CV _{DD} = 1.05 V, DSP clock = 400 MHz		341		mA
I _{DDD}	3.3V I/O (DV _{DD33}) supply current ⁽⁵⁾	DV _{DD} = 3.3 V, CV _{DD} = 1.2 V, DSP clock = 700 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.2 V, DSP clock = 660 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.2 V, DSP clock = 600 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.2 V, DSP clock = 500 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.2 V, DSP clock = 400 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.05 V, DSP clock = 560 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.05 V, DSP clock = 450 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.05 V, DSP clock = 400 MHz		13		mA

- (1) For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.
- (2) I_I applies to input-only pins and bi-directional pins. For input-only pins, I_I indicates the input leakage current. For bi-directional pins, I_I indicates the input leakage current and off-state (Hi-Z) output leakage current.
- (3) Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.
- (4) I_{OZ} applies to output-only pins, indicating off-state (Hi-Z) output leakage current.
- (5) Measured under the following conditions: 60% DSP CPU utilization doing typical activity (peripheral configurations, other housekeeping activities); DDR2 Memory Controller at 50% utilization (135 MHz), 50% writes, 32 bits, 50% bit switching; 2 MHz McBSP0 at 100% utilization and 50% switching; Timer0 at 100% utilization. At room temperature (25 C) for typical process ZWT devices. The actual current draw varies across manufacturing processes and is highly application-dependent. DM643x DMP devices are offered in two basic options: lower-power option and high-performance option. Low-power devices offer lower power consumption across temperature and voltage when compared with high-performance devices. However, high-performance devices offer higher operating speeds. For more details on core and I/O activity, as well as information relevant to board power supply design, see the *TMS320DM643x Power Consumption Summary* Application Report (literature number [SPRAA06](#)).

6 Peripheral Information and Electrical Specifications

6.1 Parameter Information

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 6-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

6.1.1 3.3-V Signal Transition Levels

All input and output timing parameters are referenced to V_{ref} for both "0" and "1" logic levels. For 3.3 V I/O, $V_{ref} = 1.5$ V. For 1.8 V I/O, $V_{ref} = 0.9$ V.

Figure 6-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to V_{IL} MAX and V_{IH} MIN for input clocks, V_{OL} MAX and V_{OH} MIN for output clocks.

Figure 6-3. Rise and Fall Transition Time Voltage Reference Levels

6.1.2 3.3-V Signal Transition Rates

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

6.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays.

TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number [SPRA839](#)). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For the DDR2 memory controller interface, it is *not* necessary to use the IBIS models to analyze timing characteristics. TI provides a PCB routing rules solution that describes the routing rules to ensure the DDR2 memory controller interface timings are met. See the *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number [SPRAAL6](#)).

6.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

6.3 Power Supplies

For more information regarding TI's power management products and suggested devices to power TI DSPs, visit www.ti.com/dsppower.

6.3.1 Power-Supply Sequencing

The DM6435 includes one core supply (CV_{DD}), and two I/O supplies— DV_{DD33} and DV_{DDR2} . To ensure proper device operation, a specific power-up sequence **must** be followed. Some TI power-supply devices include features that facilitate power sequencing—for example, Auto-Track and Slow-Start/Enable features. For more information on TI power supplies and their features, visit www.ti.com/dsppower.

Here is a summary of the power sequencing requirements:

- The power ramp order **must** be DV_{DD33} before DV_{DDR2} , and DV_{DDR2} before CV_{DD} —meaning during power up, the voltage at the DV_{DDR2} rail should never exceed the voltage at the DV_{DD33} rail. Similarly, the voltage at the CV_{DD} rail should never exceed the voltage at the DV_{DDR2} rail.
- From the time that power ramp begins, all power supplies (DV_{DD33} , DV_{DDR2} , CV_{DD}) **must** be stable within 200 ms. The term "stable" means reaching the recommended operating condition (see [Section 5.2, Recommended Operating Conditions](#) table).

6.3.2 Power-Supply Design Considerations

Core and I/O supply voltage regulators should be located close to the DSP to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the DM6435 device, the PC board should include separate power planes for core, I/O, and ground; all bypassed with high-quality low-ESL/ESR capacitors.

6.3.3 Power-Supply Decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. These caps need to be close to the DSP, no more than 1.25 cm maximum distance to be effective. Physically smaller caps are better, such as 0402, but need to be evaluated from a yield/manufacturing point-of-view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value.

Larger caps for each supply can be placed further away for bulk decoupling. Large bulk caps (on the order of 100 μ F) should be furthest away, but still as close as possible. Large caps for each supply should be placed outside of the BGA footprint.

As with the selection of any component, verification of capacitor availability over the product's production lifetime should be considered.

For more details on capacitor usage and placement, see the *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number [SPRAAL6](#)).

6.3.4 DM6435 Power and Clock Domains

The DM6435 includes one single power domain — the "Always On" power domain. The "Always On" power domain is always on when the chip is on. The "Always On" domain is powered by the CV_{DD} pins of the DM6435. All DM6435 modules lie within the "Always On" power domain. [Table 6-1](#) provides a listing of the DM6435 clock domains.

One primary reference clock is required for the DM6435 device. The can be either a crystal input or driven by external oscillators. A 27-MHz crystal is recommended for the system PLLs, which generate the internal clocks for the digital media processor, coprocessors, peripherals (including imaging peripherals), and the EDMA3. For further description of the DM6435 clock domains, see [Table 6-3](#) and [Figure 6-4](#).

Table 6-1. DM6435 Power and Clock Domains

Power Domain	Clock Domain	Peripheral/Module
Always On	CLKIN	UART0
Always On	CLKIN	UART1
Always On	CLKIN	HECC
Always On	CLKIN	I2C
Always On	CLKIN	Timer0
Always On	CLKIN	Timer1
Always On	CLKIN	Timer2
Always On	CLKIN	PWM0
Always On	CLKIN	PWM1
Always On	CLKIN	PWM2
Always On	CLKDIV3	DDR2

Table 6-2. DM6435 Clock Domains

SUBSYSTEM	CLOCK DOMAIN	DOMAIN CLOCK SOURCE	FIXED RATIO vs. SYSCLK1 FREQUENCY	EXAMPLE FREQUENCY (MHz)
Peripherals (CLKIN Domain)	CLKIN	PLL1 AUXCLK ⁽¹⁾	–	27 MHz
DSP Subsystem	CLKDIV1	PLL1 SYSCLK1	1:1	594 MHz
EDMA3	CLKDIV3	PLL1 SYSCLK2	1:3	198 MHz
VPSS	CLKDIV3	PLL1 SYSCLK2	1:3	198 MHz
Peripherals (CLKDIV3 Domain)	CLKDIV3	PLL1 SYSCLK2	1:3	198 MHz

(1) PLL1 AUXCLK runs at exactly the same frequency as the device clock source from the MXI/CLKIN pin.

Table 6-2. DM6435 Clock Domains (continued)

SUBSYSTEM	CLOCK DOMAIN	DOMAIN CLOCK SOURCE	FIXED RATIO vs. SYSCLK1 FREQUENCY	EXAMPLE FREQUENCY (MHz)
Peripherals (CLKDIV6 Domain)	CLKDIV6	PLL1 SYCLK3	1:6	99 MHz

The CLKDIV1:CLKDIV3:CLKDIV6 ratio must be strictly followed by programming the PLL Controller 1 (PLL1) PLLDIV1, PLLDIV2, and PLLDIV3 registers appropriately (see Table 6-3).

Table 6-3. PLL1 Programming for CLKDIV1, CLKDIV3, CLKDIV6 Domains

	CLKDIV1 DOMAIN (SYSCLK1)		CLKDIV3 DOMAIN (SYSCLK2)		CLKDIV6 DOMAIN (SYSCLK3)	
	PLL1 Divide-Down	PLLDIV1.RATIO	PLL1 Divide-Down	PLLDIV2.RATIO	PLL1 Divide-Down	PLLDIV3.RATIO
DIV1	/1	0	/3	2	/6	5
DIV2	/2	1	/6	5	/12	11
DIV3	/3	2	/9	8	/18	17

Figure 6-4. PLL1 and PLL2 Clock Domain Block Diagram

For further detail on PLL1 and PLL2, see the structure block diagrams Figure 6-5 and Figure 6-6, respectively.

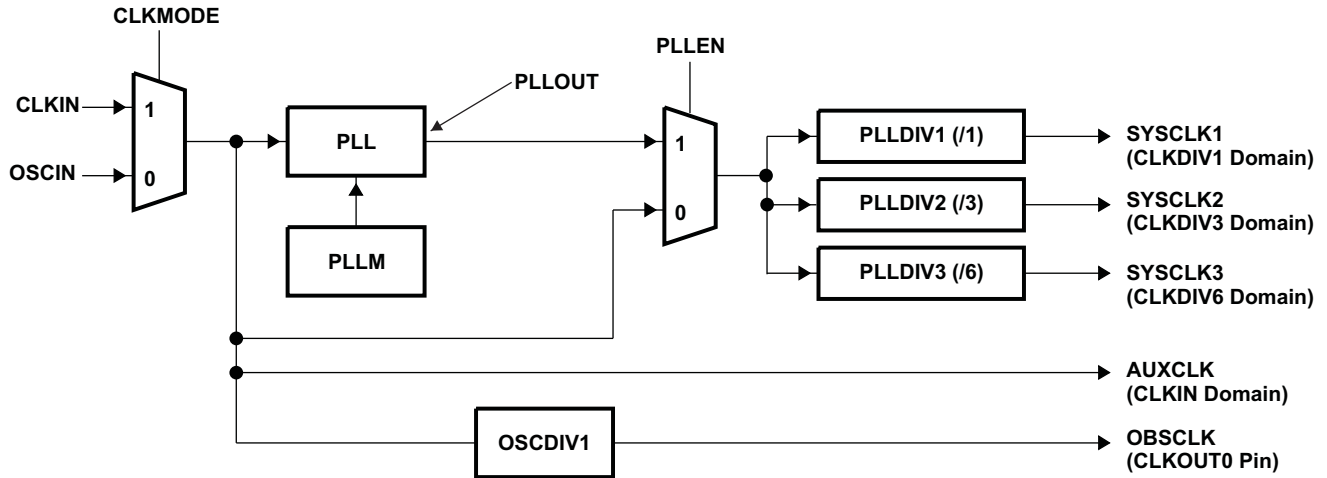

Figure 6-5. PLL1 Structure Block Diagram

Figure 6-6. PLL2 Structure Block Diagram

6.3.5 Power and Sleep Controller (PSC)

The Power and Sleep Controller (PSC) controls power by turning off unused power domains or by gating off clocks to individual peripherals/modules. The DM6435 device only utilizes the clock gating feature of the PSC for power savings. The PSC consists of a Global PSC (GPSC) and a set of Local PSCs (LPSCs). The GPSC contains memory mapped registers, PSC interrupt control, and a state machine for each peripheral/module. An LPSC is associated with each peripheral/module and provides clock and reset control. The LPSCs for DM6435 are shown in [Table 6-4](#). The PSC Register memory map is given in [Table 6-5](#). For more details on the PSC, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

0x01C4 1A0C	MDCTL3	Module Control 3 Register (EDMATC0)
0x01C4 1A10	MDCTL4	Module Control 4 Register (EDMATC1)
0x01C4 1A14	MDCTL5	Module Control 5 Register (EMACTC2)
0x01C4 1A18	MDCTL6	Module Control 6 Register (EMAC Memory Controller)
0x01C4 1A1C	MDCTL7	Module Control 7 Register (MDIO)
0x01C4 1A20	MDCTL8	Module Control 8 Register (EMAC)
0x01C4 1A24	MDCTL9	Module Control 9 Register (McASP0)
0x01C4 1A28	-	Reserved
0x01C4 1A2C	MDCTL11	Module Control 11 Register (VLYNQ)
0x01C4 1A30	MDCTL12	Module Control 12 Register (HPI)
0x01C4 1A34	MDCTL13	Module Control 13 Register (DDR2)
0x01C4 1A38	MDCTL14	Module Control 14 Register (EMIFA)
0x01C4 1A3C	-	Reserved
0x01C4 1A40	MDCTL16	Module Control 16 Register (McBSP0)
0x01C4 1A44	-	Reserved
0x01C4 1A48	MDCTL18	Module Control 18 Register (I2C)
0x01C4 1A4C	MDCTL19	Module Control 19 Register (UART0)
0x01C4 1A50	MDCTL20	Module Control 20 Register (UART1)
0x01C4 1A54	-	Reserved
0x01C4 1A58	MDCTL22	Module Control 22 Register (HECC)
0x01C4 1A5C	MDCTL23	Module Control 23 Register (PWM0)
0x01C4 1A60	MDCTL24	Module Control 24 Register (PWM1)
0x01C4 1A64	MDCTL25	Module Control 25 Register (PWM2)
0x01C4 1A68	MDCTL26	Module Control 26 Register (GPIO)
0x01C4 1A6C	MDCTL27	Module Control 27 Register (TIMER0)
0x01C4 1A70	MDCTL28	Module Control 28 Register (TIMER1)
0x01C4 1A74 - 0x01C4 1A9B	-	Reserved
0x01C4 1A9C	MDCTL39	Module Control 39 Register (C64x+ CPU)
0x01C4 1AA0	-	Reserved
0x01C4 1AA4 - 0x01C4 1FFF	-	Reserved

6.4 Enhanced Direct Memory Access (EDMA3) Controller

The EDMA controller handles all data transfers between memories and the device slave peripherals on the DM6435 device. These data transfers include cache servicing, non-cacheable memory accesses, user-programmed data transfers, and host accesses. These are summarized as follows:

- Transfer to/from on-chip memories
 - DSP L1D memory
 - DSP L2 memory
- Transfer to/from external storage
 - DDR2 SDRAM
 - NAND flash
 - Asynchronous EMIF (EMIFA)
- Transfer to/from peripherals/hosts
 - VLYNQ
 - HPI
 - McBSP0
 - McASP0
 - PWM
 - UART0/1
 - HECC

The EDMA supports two addressing modes: constant addressing and increment addressing. On the DM6435, constant addressing mode is **not** supported by any peripheral or internal memory. For more information on these two addressing modes, see the *TMS320DM643x DMP Enhanced Direct Memory Access (EDMA3) Controller User's Guide* (literature number [SPRU987](#)).

6.4.1 EDMA3 Channel Synchronization Events

The EDMA supports up to 64 EDMA channels which service peripheral devices and external memory. [Table 6-6](#) lists the source of EDMA synchronization events associated with each of the programmable EDMA channels. For the DM6435 device, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. These specific events are captured in the EDMA event registers (ER, ERH) even if the events are disabled by the EDMA event enable registers (EER, EERH). For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the *TMS320DM643x DMP Enhanced Direct Memory Access (EDMA3) Controller User's Guide* (literature number [SPRU987](#)).

Table 6-6. DM6435 EDMA Channel Synchronization Events⁽¹⁾

EDMA CHANNEL	EVENT NAME	EVENT DESCRIPTION
0-1	–	Reserved
2	XEVT0	McBSP0 Transmit Event
3	REVT0	McBSP0 Receive Event
4	–	Reserved
5	–	Reserved
6	HISTEVT	VPSS Histogram Event
7	H3AEVT	VPSS H3A Event
8	PRVUEVT	VPSS Previewer Event
9	RSZEVT	VPSS Resizer Event
10	AXEVTE0	McASP0 Transmit Event Even

(1) In addition to the events shown in this table, each of the 64 channels can also be synchronized with the transfer completion or alternate transfer completion events. For more detailed information on EDMA event-transfer chaining, see the *Document Support* section for the Enhanced Direct Memory Access (EDMA) Controller Reference Guide.

Table 6-6. DM6435 EDMA Channel Synchronization Events (continued)

EDMA CHANNEL	EVENT NAME	EVENT DESCRIPTION
11	AXEVT00	McASP0 Transmit Event Odd
12	AXEVT0	McASP0 Transmit Event
13	AREVTE0	McASP0 Receive Event Even
14	AREVTO0	McASP0 Receive Event Odd
15	AREVT0	McASP0 Receive Event
16-21	–	Reserved
22	URXEVT0	UART 0 Receive Event
23	UTXEVT0	UART 0 Transmit Event
24	URXEVT1	UART 1 Receive Event
25	UTXEVT1	UART 1 Transmit Event
26	–	Reserved
27	–	Reserved
28	ICREVT	I2C Receive Event
29	ICXEVT	I2C Transmit Event
30-31	–	Reserved
32	GPINT0	GPIO 0 Interrupt
33	GPINT1	GPIO 1 Interrupt
34	GPINT2	GPIO 2 Interrupt
35	GPINT3	GPIO 3 Interrupt
36	GPINT4	GPIO 4 Interrupt
37	GPINT5	GPIO 5 Interrupt
38	GPINT6	GPIO 6 Interrupt
39	GPINT7	GPIO 7 Interrupt
40	GPBNKINT0	GPIO Bank 0 Interrupt
41	GPBNKINT1	GPIO Bank 1 Interrupt
42	GPBNKINT2	GPIO Bank 2 Interrupt
43	GPBNKINT3	GPIO Bank 3 Interrupt
44	GPBNKINT4	GPIO Bank 4 Interrupt
45	GPBNKINT5	GPIO Bank 5 Interrupt
46	GPBNKINT6	GPIO Bank 6 Interrupt
47	–	Reserved
48	TEVTL0	Timer 0 Event Low Interrupt
49	TEVTH0	Timer 0 Event High Interrupt
50	TEVTL1	Timer 1 Event Low Interrupt
51	TEVTH1	Timer 1 Event High Interrupt
52	PWM0	PWM 0 Event
53	PWM1	PWM 1 Event
54	PWM2	PWM 2 Event
55-63	–	Reserved

6.4.2 EDMA Peripheral Register Description(s)

Table 6-7 lists the EDMA registers, their corresponding acronyms, and DM6435 device memory locations.

Table 6-7. DM6435 EDMA Registers

HEX ADDRESS	ACRONYM	REGISTER NAME
Channel Controller Registers		
0x01C0 0000 - 0x01C0 0003		Reserved
0x01C0 0004	CCCFG	EDMA3CC Configuration Register
0x01C0 0008 - 0x01C0 01FF		Reserved
Global Registers		
0x01C0 0200	QCHMAP0	QDMA Channel 0 Mapping to PaRAM Register
0x01C0 0204	QCHMAP1	QDMA Channel 1 Mapping to PaRAM Register
0x01C0 0208	QCHMAP2	QDMA Channel 2 Mapping to PaRAM Register
0x01C0 020C	QCHMAP3	QDMA Channel 3 Mapping to PaRAM Register
0x01C0 0210	QCHMAP4	QDMA Channel 4 Mapping to PaRAM Register
0x01C0 0214	QCHMAP5	QDMA Channel 5 Mapping to PaRAM Register
0x01C0 0218	QCHMAP6	QDMA Channel 6 Mapping to PaRAM Register
0x01C0 021C	QCHMAP7	QDMA Channel 7 Mapping to PaRAM Register
0x01C0 0240	DMAQNUM0	DMA Queue Number Register 0 (Channels 00 to 07)
0x01C0 0244	DMAQNUM1	DMA Queue Number Register 1 (Channels 08 to 15)
0x01C0 0248	DMAQNUM2	DMA Queue Number Register 2 (Channels 16 to 23)
0x01C0 024C	DMAQNUM3	DMA Queue Number Register 3 (Channels 24 to 31)
0x01C0 0250	DMAQNUM4	DMA Queue Number Register 4 (Channels 32 to 39)
0x01C0 0254	DMAQNUM5	DMA Queue Number Register 5 (Channels 40 to 47)
0x01C0 0258	DMAQNUM6	DMA Queue Number Register 6 (Channels 48 to 55)
0x01C0 025C	DMAQNUM7	DMA Queue Number Register 7 (Channels 56 to 63)
0x01C0 0260	QDMAQNUM	CC QDMA Queue Number

Table 6-8 shows an abbreviation of the set of registers which make up the parameter set for each of 128 EDMA events. Each of the parameter register sets consist of 8 32-bit word entries. Table 6-9 shows the parameter set entry registers with relative memory address locations within each of the parameter sets.

Table 6-8. EDMA Parameter Set RAM

HEX ADDRESS RANGE	DESCRIPTION
0x01C0 4000 - 0x01C0 401F	Parameters Set 0 (8 32-bit words)
0x01C0 4020 - 0x01C0 403F	Parameters Set 1 (8 32-bit words)
0x01C0 4040 - 0x01C0 405F	Parameters Set 2 (8 32-bit words)
0x01C0 4060 - 0x01C0 407F	Parameters Set 3 (8 32-bit words)
0x01C0 4080 - 0x01C0 409F	Parameters Set 4 (8 32-bit words)
0x01C0 40A0 - 0x01C0 40BF	Parameters Set 5 (8 32-bit words)
...	...
0x01C0 4FC0 - 0x01C0 4FDF	Parameters Set 126 (8 32-bit words)
0x01C0 4FE0 - 0x01C0 4FFF	Parameters Set 127 (8 32-bit words)

Table 6-9. Parameter Set Entries

HEX OFFSET ADDRESS WITHIN THE PARAMETER SET	ACRONYM	PARAMETER ENTRY
0x0000	OPT	Option
0x0004	SRC	Source Address

0x000C	DST	Destination Address
0x0010	SRC_DST_BIDX	Source B Index, Destination B Index
0x0014	LINK_BCNTRLD	Link Address, B Count Reload
0x0018	SRC_DST_CIDX	Source C Index, Destination C Index
0x001C	CCNT	C Count

6.5 Reset

The reset controller detects the different type of resets supported on the DM6435 device and manages the distribution of those resets throughout the device.

The DM6435 device has several types of device-level global resets - power-on reset, warm reset, and max reset. Table 6-10 explains further the types of reset, the reset initiator, and the effects of each reset on the chip. See Section 6.5.9, *Reset Electrical Data/Timing*, for more information on the effects of each reset on the PLL controllers and their clocks.

Table 6-10. Device-Level Global Reset Types

TYPE	INITIATOR	EFFECT(s)
Power-on Reset (POR)	$\overline{\text{POR}}$ pin	Global chip reset (Cold reset). Activates the POR signal on chip, which resets the entire chip including the emulation logic. The power-on reset (POR) pin must be driven low during power ramp of the device. Device boot and configuration pin are latched.
Warm Reset	$\overline{\text{RESET}}$ pin	Resets everything except for the emulation logic. Emulator stays alive during Warm Reset. Device boot and configuration pin are latched.
Max Reset	Emulator, WD Timer (Timer 2)	Same as a Warm Reset, except the DM6435 device boot and configuration pins are not re-latched.

In addition to device-level global resets, the PSC provides the capability to cause local resets to peripherals and/or the CPU.

6.5.1 Power-on Reset ($\overline{\text{POR}}$ Pin)

Power-on Reset (POR) is initiated by the $\overline{\text{POR}}$ pin and is used to reset the entire chip, including the emulation logic. Power-on Reset is also referred to as a cold reset since the device usually goes through a power-up cycle. During power-up, the $\overline{\text{POR}}$ pin must be asserted (driven low) until the power supplies have reached their normal operating conditions. If an external 27-MHz oscillator is used on the MXI/CLKIN pin, the source clock should also be running at the correct frequency prior to de-asserting the $\overline{\text{POR}}$ pin. **Note:** A device power-up cycle is not required to initiate a Power-on Reset.

The following sequence **must** be followed during a Power-on Reset.

1. Wait for the power supplies to reach normal operating conditions while keeping the $\overline{\text{POR}}$ pin asserted (driven low).
2. Wait for the input clock source to be stable while keeping the $\overline{\text{POR}}$ pin asserted (low).
3. Once the power supplies and the input clock source are stable, the $\overline{\text{POR}}$ pin **must** remain asserted (low) for a minimum of 12 MXI cycles.

Within the low period of the $\overline{\text{POR}}$ pin, the following happens:

- The reset signals flow to the entire chip (including the emulation logic), resetting the modules on chip.
 - The PLL Controller clocks start at the frequency of the MXI clock. The clocks are propagated throughout the chip to reset the chip synchronously. By default, both PLL1 and PLL2 are in reset and unlocked. The PLL Controllers default to PLL Bypass Mode.
 - The RESETOUT pin stays asserted (low), indicating the device is in reset.
4. The $\overline{\text{POR}}$ pin may now be deasserted (driven high).

When the $\overline{\text{POR}}$ pin is deasserted (high), the configuration pin values are latched and the PLL Controllers changed their system clocks to their default divide-down values. Both PLL Controllers are still in PLL Bypass Mode. Other device initialization also begins.

5. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the RESETOUT pin is deasserted (driven high).

At this point:

- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader Application Report* (literature number [SPRAAG0](#)).

After the boot sequence, follow the software initialization sequence described in [Section 3.8, Device Initialization Sequence After Reset](#).

6.5.1.1 Usage of $\overline{\text{POR}}$ versus $\overline{\text{RESET}}$ Pins

$\overline{\text{POR}}$ and $\overline{\text{RESET}}$ are independent resets.

If the device needs to go through a power-up cycle, $\overline{\text{POR}}$ (*not* $\overline{\text{RESET}}$) **must** be used to fully reset the device.

In functional end-system, emulation/debugger logic is typically *not* needed; therefore, the recommendation for functional end-system is to use the $\overline{\text{POR}}$ pin for full device reset. If $\overline{\text{RESET}}$ pin is *not* needed, it can be pulled inactive (high) via an external pullup resistor.

In a debug system, it is typically desirable to allow the reset of the device without crashing an emulation session. In this case, the user can use the $\overline{\text{POR}}$ pin to achieve full device reset and use the $\overline{\text{RESET}}$ pin to achieve a debug reset—which resets the entire device except emulation logic.

6.5.1.2 Latching Boot and Configuration Pins

Internal to the chip, the two device reset pins $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ are logically AND'd together *only* for the purpose of latching device boot and configuration pins. The values on all device and boot configuration pins are latched into the BOOTCFG register when the logical AND of $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ transitions from low-to-high.

6.5.2 Warm Reset ($\overline{\text{RESET}}$ Pin)

A Warm Reset is activated by driving the $\overline{\text{RESET}}$ pin active low. This resets everything in the device except the emulation logic. An emulator session will stay alive during warm reset.

For more information on $\overline{\text{POR}}$ vs. $\overline{\text{RESET}}$ usage, see [Section 6.5.1.1, Usage of \$\overline{\text{POR}}\$ versus \$\overline{\text{RESET}}\$ Pins](#) and [Section 6.5.1.2, Latching Boot and Configuration Pins](#).

The following sequence **must** be followed during a Warm Reset:

1. Power supplies and input clock source should already be stable.
2. The $\overline{\text{RESET}}$ pin **must** be asserted (low) for a minimum of 12 MXI cycles.

Within the low period of the $\overline{\text{RESET}}$ pin, the following happens:

- The reset signals flow to the entire chip resetting all the modules on chip, except the emulation logic.
 - The PLL Controllers are reset thereby, switching back to PLL Bypass Mode and resetting all their registers to default values. Both PLL1 and PLL2 are placed in reset and lose lock.
 - The $\overline{\text{RESETOUT}}$ pin becomes asserted (low), indicating the device is in reset.
3. The $\overline{\text{RESET}}$ pin may now be deasserted (driven high).

When the $\overline{\text{RESET}}$ pin is deasserted (high), the configuration pin values are latched and the PLL Controllers changed their system clocks to their default divide-down values. Both PLL Controllers are still in PLL Bypass Mode. Other device initialization also begins.

4. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the $\overline{\text{RESETOUT}}$ pin is deasserted (driven high).

At this point:

- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader Application Report* (literature number [SPRAAG0](#)).

After the boot sequence, follow the software initialization sequence described in [Section 3.8](#), *Device Initialization Sequence After Reset*.

6.5.3 Maximum Reset

A Maximum (Max) Reset is initiated by the emulator or the watchdog timer (Timer 2). The effects are the same as a warm reset, except the device boot and configuration pins are not re-latched. The emulator initiates a maximum reset via the ICEPICK module. This ICEPICK initiated reset is non-maskable. When the watchdog timer counter reaches zero, this will also initiate a maximum reset to recover from a runaway condition. The watchdog timeout reset condition is masked if the TIMERCTL.WDRST bit is cleared to "0".

To invoke the maximum reset via the ICEPICK module, the user can perform the following from the Code Composer Studio™ IDE menu: Debug→Advanced Resets→System Reset

This is the Max Reset sequence:

1. Max Reset is initiated by the emulator or the watchdog timer.

During this time, the following happens:

- The reset signals flow to the entire chip resetting all the modules on chip except the emulation logic.
 - The PLL Controllers are reset thereby, switching back to PLL Bypass Mode and resetting all their registers to default values. Both PLL1 and PLL2 are placed in reset and lose lock.
 - The $\overline{\text{RESETOUT}}$ pin becomes asserted (low), indicating the device is in reset.
2. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the $\overline{\text{RESETOUT}}$ pin is deasserted (driven high).

At this point:

- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. Since the boot and configuration pins are *not* latched with a Max Reset, the previous values (as shown in the BOOTCFG register) are used to select the boot mode. For more details on the boot sequence, see the *Using the TMS320DM643x Bootloader Application Report* (literature number [SPRAAG0](#)).

After the boot sequence, follow the software initialization sequence described in [Section 3.8](#), *Device Initialization Sequence After Reset*.

6.5.4 CPU Local Reset

The C64x+ DSP CPU has an internal reset input that allows a host (HPI) to control it. This reset is configured through a register bit (MDCTL[39].LRST) in the Power Sleep Controller (PSC) module. When in C64x+ local reset, the slave DMA port on C64x+ will remain active and the internal memory will be accessible. For procedures on asserting and de-asserting CPU local reset by the host, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

For information on peripheral selection at the rising edge of $\overline{\text{POR}}$ or $\overline{\text{RESET}}$, see [Section 3, Device Configurations](#) of this data manual.

6.5.5 Peripheral Local Reset

The user can configure the local reset and clock state of a peripheral through programming the PSC. [Table 6-4, DM6435 LPSC Assignments](#) identifies the LPSC numbers and the peripherals capable of being locally reset by the PSC. For more detailed information on the programming of these peripherals by the PSC, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

6.5.6 Reset Priority

If any of the above reset sources occur simultaneously, the PLLC only processes the highest priority reset request. The reset request priorities are as follows (high to low):

- Power-on Reset
- Maximum Reset
- Warm Reset
- CPU Reset

6.5.7 Reset Controller Register

The Reset Type Status (RSTYPE) register (01C4 00E4) is the only register for the reset controller. This register falls in the same memory range as the PLL1 controller registers (see [Table 6-18](#) for the PLL1 Controller Registers (including Reset Controller)). For more details on the RSTYPE register, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

6.5.8 Pin Behaviors at Reset

During normal operations, pins are controlled by the respective peripheral selected in the PINMUX0 or PINMUX1 register. During device level global reset, the pin behaves as follows:

Multiplexed Boot and Configuration Pins

These pins are forced 3-stated when $\overline{\text{RESETOUT}}$ is asserted (low). This is to ensure the proper boot and configuration values can be latched on these multiplexed pins. This is particularly useful in the case where the boot and configuration values are driven by an external control device. After $\overline{\text{RESETOUT}}$ is deasserted (high), these pins are controlled by their respective default peripheral.

- **Boot and Configuration Pins Group:** GP[28], GP[27], GP[26]/(FASTBOOT), GP[25]/(BOOTMODE3), GP[24]/(BOOTMODE2), GP[23]/(BOOTMODE1), GP[22]/(BOOTMODE0), EM_A[4]/GP[10]/(AEAW2/PLLMS2), EM_A[1]/(ALE)/GP[9]/(AEAW1/PLLMS1), EM_A[2]/(CLE)/GP[8]/(AEAW0/PLLMS0), EM_A[0]/GP[7]/(AEM2), EM_BA[0]/GP[6]/(AEM1), and EM_BA[1]/GP[5]/(AEM0).

For information on whether external pullup/pulldown resistors should be used on the boot and configuration pins, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

Default Power Down Pins

As discussed in [Section 3.2, Power Considerations](#), the VDD3P3V_PWDN register controls power to the 3.3-V pins. The VDD3P3V_PWDN register defaults to powering down some 3.3-V pins to save power. For more details on the VDD3P3V_PWDN register and which 3.3-V pins default to powerup or powerdown, [Section 3.2, Power Considerations](#). The pins that default to powerdown, are both reset to powerdown and high-impedance. They remain in that state until configured otherwise by VDD3P3_PWDN and PINMUX0/PINMUX1 programming.

- **Default Power Down Pin Group:** GP[4]/PWM1, ACLKR0/CLKX0/GP[99], AFSR0/DR0/GP[100], AHCLKR0/CLKR0/GP[101], AXR0[3]/FSR0/GP[102], AXR0[2]/FSX0/GP[103], AXR0[1]/DX0/GP[104], AXR0/GP[105], ACLKX0/GP[106], AFSX0/GP[107], AHCLKX0/GP[108], AMUTEIN0/GP[109], AMUTE0/GP[110], HECC_TX/TOUT1L/UTXD1/GP[55], HECC_RX/TINP1L/URXD1/GP[56], CLKS0/TOUT0L/GP[97], TINP0L/GP[98], URXD0/GP[85], UTXD0/GP[86], UCTS0/GP[87], and URTS0/PWM0/GP[88].

All Other Pins

During $\overline{\text{RESETOUT}}$ assertion (low), all other pins are controlled by the default peripheral. The default peripheral is determined by the default settings of the PINMUX0 or PINMUX1 registers.

Some of the PINMUX0/PINMUX1 settings are determined by configuration pins latched at reset. To determine the reset behavior of these pins, see [Section 3.7, Multiplexed Pin Configurations](#) and read the rest of this subsection to understand how that default peripheral controls the pin.

The reset behaviors for all these other pins are categorized as follows (also see [Figure 6-7](#) and [Figure 6-8](#) in [Section 6.5.9, Reset Electrical Data/Timing](#)):

- **Z+/Low Group (Z Longer-to-Low Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. These pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins drive a logic low.
- **Z+/High Group (Z Longer-to-High Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. These pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins drive a logic high.
- **Z+/Invalid Group (Z Longer-to-Invalid Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. These pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins drive an invalid value until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Z Group:** These pins are 3-stated by default, and these pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins remain 3-stated until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Low Group:** These pins are low by default, and remain low until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **High Group:** These pins are high by default, and remain high until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Z/Low Group (Z-to-Low Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. When the reset source is deasserted, these pins drive a logic low.
- **Z/High Group (Z-to-High Group):** These pins are 3-stated when device-level global reset source (e.g., POR, $\overline{\text{RESET}}$, or Max Reset) is asserted. When reset source is deasserted, these pins drive a logic high.
- **Clock Group:** These clock pins are toggling by default. They paused momentarily before $\overline{\text{RESETOUT}}$ is deasserted (high). The *only* pin in the Clock Group is CLKOUT0.

This is a list of possible default peripherals and how they control the pins during reset:

- **GPIO:** All GPIO pins behave according to Z Group.

Note: The following EMIFA list *only* includes pins that can default to function as EMIFA signals.

- **EMIFA:** These EMIFA signals are multiplexed with boot and configuration pins: EM_A[4], EM_A[2:0], EM_BA[0], EM_BA[1]; therefore, they are forced 3-stated throughout RESETOUT.
 - **Z+/Low Group:** EM_A[4], EM_A[2:0]
 - **Z+/High Group:** EM_BA[0], EM_BA[1], $\overline{\text{EM_OE}}$, $\overline{\text{EM_WE}}$
 - **Z+/Invalid Group:** EM_D[7:0]
 - **Z/Low Group:** EM_A[21:5], EM_A[3], EM_R $\overline{\text{W}}$
 - **Z/High Group:** $\overline{\text{EM_CS2}}$
 - **Z Group:** EM_WAIT/(RDY $\overline{\text{BSY}}$)
- **DDR2 Memory Controller:**
 - **Clock Group:** DDR_CLK, $\overline{\text{DDR_CLK}}$
 - **DDR2 Z Group:** DDR_DQM[3:0], DDR_DQS[3:0], DDR_D[31:0]
 - **DDR2 Low Group:** DDR_CKE, DDR_BA[2:0], DDR_A[12:0]
 - **DDR2 High Group:** $\overline{\text{DDR_CS}}$, $\overline{\text{DDR_WE}}$, $\overline{\text{DDR_RAS}}$, $\overline{\text{DDR_CAS}}$
- **I2C:** All I2C pins behave according to Z Group.
- **JTAG:** TDO, EMU0, and EMU1 pins behave according to Z Group. TCK, TDI, TMS, and $\overline{\text{TRST}}$ are input-only pins.
- **Clock:** CLKOUT0

For more information on the pin behaviors during device-level global reset, see [Figure 6-7](#) and [Figure 6-8](#) in [Section 6.5.9, Reset Electrical Data/Timing](#).

6.5.9 Reset Electrical Data/Timing

Note: If a configuration pin *must* be routed out from the device, the internal pullup/pulldown (IPU/IPD) resistor should *not* be relied upon; TI recommends the use of an external pullup/pulldown resistor.

Table 6-11. Timing Requirements for Reset (see [Figure 6-7](#) and [Figure 6-8](#))

NO.			-7I-6I-5I-4 -LI-Q6I-Q5I-Q4		UNIT
			MIN	MAX	
1	$t_{w(\text{RESET})}$	Pulse duration, $\overline{\text{POR}}$ low or $\overline{\text{RESET}}$ low	12C ⁽¹⁾		ns
4	$t_{su(\text{CONFIG})}$	Setup time, boot and configuration pins valid before $\overline{\text{POR}}$ high or $\overline{\text{RESET}}$ high ⁽²⁾	12C ⁽¹⁾		ns
5	$t_{h(\text{CONFIG})}$	Hold time, boot and configuration pins valid after $\overline{\text{POR}}$ high or $\overline{\text{RESET}}$ high ⁽²⁾	0		ns

(1) C = 1/MXI clock frequency in ns. The device clock source *must* be stable and at a valid frequency prior to meeting the $t_{w(\text{RESET})}$ requirement.

(2) For the list of boot and configuration pins, see [Table 2-5, Boot Terminal Functions](#).

Table 6-12. Switching Characteristics Over Recommended Operating Conditions During Reset⁽¹⁾ (see [Figure 6-8](#))

NO.	PARAMETER	-7I-6I-5I-4 -LI-Q6I-Q5I-Q4		UNIT
		MIN	MAX	
2	$t_{d(\text{RSTH-RSTOUTH})}$	1900C		ns
3	$t_{w(\text{PAUSE})}$	10C	10C	ns
6	$t_{d(\text{RSTL-IV})}$	20		ns
7	$t_{d(\text{RSTH-V})}$	20		ns
8	$t_{d(\text{RSTOUTH-V})}$	0		ns
9	$t_{d(\text{RSTOUTH-IV})}$	12C		ns

(1) C = 1/CLKIN1 clock frequency in ns.

Figure 6-7 shows the Power-Up Timing. Figure 6-8 shows the Warm Reset ($\overline{\text{RESET}}$) Timing. Max Reset Timing is identical to Warm Reset Timing, except the boot and configuration pins are *not* relatched and the BOOTCFG register retains its previous value latched before the Max Reset was initiated.

- A. Power supplies and MXI must be stable before the start of $t_{W(RESET)}$.
- B. Pin reset behavior depends on which peripheral defaults to controlling the multiplexed pin. For more details on what pin group (e.g., Z Group, Z/Low Group, Z/High Group, etc.) each pin belongs to, see [Section 6.5.8, Pin Behaviors at Reset](#).

Figure 6-7. Power-Up Timing^(B)

A. Pin reset behavior depends on which peripheral defaults to controlling the multiplexed pin. For more details on what pin group (e.g., Z Group, Z/Low Group, Z/High Group, etc.) each pin belongs to, see [Section 6.5.8, Pin Behaviors at Reset](#).

Figure 6-8. Warm Reset ($\overline{\text{RESET}}$) Timing^(A)

6.6 External Clock Input From MXI/CLKIN Pin

The DM6435 device includes two options to provide an external clock input:

- Use an on-chip oscillator with external crystal.
- Use an external 1.8-V LVCMOS-compatible clock input.

The optimal external clock input frequency is 27 MHz. Section 6.6.1 provides more details on Option 1, using an on-chip oscillator with external crystal. Section 6.6.2 provides details on Option 2, using an external 1.8-V LVCMOS-compatible clock input.

6.6.1 Clock Input Option 1—Crystal

In this option, a crystal is used as the external clock input to the DM6435.

The 27-MHz oscillator provides the reference clock for all DM6435 subsystems and peripherals. The on-chip oscillator requires an external 27-MHz crystal connected across the MXI and MXO pins, along with two load capacitors, as shown in Figure 6-9. The external crystal load capacitors **must** be connected only to the 27-MHz oscillator ground pin (MXV_{SS}). **Do not** connect to board ground (V_{SS}). The MXV_{DD} pin can be connected to the same 1.8 V power supply as DV_{DDR2}.

Figure 6-9. 27-MHz System Oscillator

The load capacitors, C₁ and C₂, should be chosen such that the equation is satisfied (typical values are C₁ = C₂ = 10 pF). C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator pins (MXI and MXO) and to the MXV_{SS} pin.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)}$$

Table 6-13. Input Requirements for Crystal

PARAMETER	MIN	TYP	MAX	UNIT
Start-up time (from power up until oscillating at stable frequency of 27 MHz)			4	ms
Oscillation frequency		27		MHz
ESR			60	Ω
Frequency Stability ⁽¹⁾			±50	ppm

(1) For video and audio applications, stability of the input clock is very important. The user should select crystals with low enough ppm to ensure good video and audio quality for the specific application.

6.6.2 Clock Input Option 2—1.8-V LVCMOS-Compatible Clock Input

In this option, a 1.8-V LVCMOS-Compatible Clock Input is used as the external clock input to the DM6435. The external connections are shown in [Figure 6-10](#). The MXI/CLKIN pin is connected to the 1.8-V LVCMOS-Compatible clock source. The MXO pin is left unconnected. The MXV_{SS} pin is connected to board ground (V_{SS}). The MXV_{DD} pin can be connected to the same 1.8-V power supply as DV_{DDR2}.

Figure 6-10. 1.8-V LVCMOS-Compatible Clock Input

The clock source **must** meet the MXI/CLKIN timing requirements in [Section 6.7.4, Clock PLL Electrical Data/Timing \(Input and Output Clocks\)](#).

6.7 Clock PLLs

There are two independently controlled PLLs on DM6435. PLL1 generates the frequencies required for the DSP, DMA, VPFE, and other peripherals. PLL2 generates the frequencies required for the DDR2 interface. The recommended reference clock for both PLLs is the 27-MHz crystal input.

6.7.1 PLL1 and PLL2

Both PLL1 and PLL2 power is supplied externally via the 1.8 V PLL power-supply pin (PLL_{PWR18}). An external EMI filter circuit **must** be added to PLL_{PWR18}, as shown in Figure 6-11. The 1.8-V supply of the EMI filter must be from the same 1.8-V power plane supplying the device's 1.8-V I/O power-supply pins (DV_{DDDR2}). TI recommends EMI filter manufacturer Murata, part number NFM18CC222R1C3.

All PLL external components (C1, C2, and the EMI Filter) **must** be placed as close to the device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown in Figure 6-11. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).

Figure 6-11. PLL1 and PLL2 External Connection

The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see Section 6.7.4, *Clock PLL Electrical Data/Timing (Input and Output Clocks)*.

There is an allowable range for PLL multiplier (PLLM). There is a minimum and maximum operating frequency for MXI/CLKIN, PLLOUT, and the device clocks (SYSCLKs). The PLL Controllers **must** be configured not to exceed any of these constraints documented in this section (certain combinations of external clock inputs, internal dividers, and PLL multiply ratios might not be supported). For these constraints (ranges), see Table 6-14 through Table 6-16.

Table 6-14. PLL1 and PLL2 Multiplier Ranges

PLL MULTIPLIER (PLLM)	MIN	MAX
PLL1 Multiplier	x14	x30
PLL2 Multiplier	x14	x32

Table 6-15. PLLC1 Clock Frequency Ranges

CLOCK SIGNAL NAME		MIN	MAX	UNIT
MXI/CLKIN ⁽¹⁾		20	30	MHz
PLLOUT CV _{DD} = 1.2 V	-7 devices	300	700	MHz
	-6/-5/-4/-L/-Q6/-Q5/-Q4 devices	300	600	MHz
PLLOUT CV _{DD} = 1.05 V	-7 devices	300	520	MHz
	-6/-5/-4/-L/-Q5 devices	300	520	MHz
SYSCLK1 ⁽²⁾ (CLKDIV1 Domain) CV _{DD} = 1.2 V	-7 devices		700	MHz
	-Q6 devices		660	MHz
	-6/-L devices		600	MHz
	-5/-Q5 devices		500	MHz
	-4/-Q4 devices		400	MHz
SYSCLK1 ⁽²⁾ (CLKDIV1 Domain), CV _{DD} = 1.05 V	-7 devices		520	MHz
	-6/-L devices		450	MHz
	-5/-Q5 devices		400	MHz
	-4 devices		350	MHz

- (1) MXI/CLKIN input clock is used for both PLL Controllers (PLLC1 and PLLC2).
(2) Applies to "tape and reel" part number counterparts as well. For more information, see [Section 2.8, Device and Development-Support Tool Nomenclature](#).

Table 6-16. PLLC2 Clock Frequency Ranges

CLOCK SIGNAL NAME		MIN	MAX	UNIT
MXI/CLKIN ⁽¹⁾		20	30	MHz
PLLOUT	At 1.2-V CV _{DD}	300	900	MHz
	At 1.05-V CV _{DD}	300	666	MHz
PLL2_SYSCLK1 (to DDR2 PHY)			333	MHz

- (1) MXI/CLKIN input clock is used for both PLL Controllers (PLLC1 and PLLC2).

Both PLL1 and PLL2 have stabilization, lock, and reset timing requirements that **must** be followed.

The PLL stabilization time is the amount of time that **must** be allotted for the internal PLL regulators to become stable after the PLL is powered up (after PLLCTL.PLLPWRDN bit goes through a 1-to-0 transition). The PLL should *not* be operated until this stabilization time has expired. This stabilization step **must** be applied after these resets—a Power-on Reset, a Warm Reset, or a Max Reset, as the PLLCTL.PLLPWRDN bit resets to a "1". For the PLL stabilization time value, see [Table 6-17](#).

The PLL reset time is the amount of wait time needed for the PLL to properly reset (writing PLLRST = 0) before bringing the PLL out of reset (writing PLLRST = 1). For the PLL reset time value, see [Table 6-17](#).

The PLL lock time is the amount of time needed from when the PLL is taken out of reset (PLLRST = 1 with PLEN = 0) to when the PLL controller can be switched to PLL mode (PLEN = 1). For the PLL lock time value, see [Table 6-17](#).

Table 6-17. PLL1 and PLL2 Stabilization, Lock, and Reset Times

PLL STABILIZATION/LOCK/RESET TIME	MIN	TYP	MAX	UNIT
PLL Stabilization Time	150			μs
PLL Lock Time			2000C ⁽¹⁾	ns
PLL Reset Time	128C ⁽¹⁾			ns

- (1) C = CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use C = 37.037 ns.

For details on the PLL initialization software sequence, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

For more information on the clock domains and their clock ratio restrictions, see [Section 6.3.4, DM6435 Power and Clock Domains](#).

6.7.2 PLL Controller Register Description(s)

A summary of the PLL controller registers is shown in [Table 6-18](#). For more details, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

6.7.3 Clock PLL Considerations with External Clock Sources

If the internal oscillator is bypassed, to minimize the clock jitter a single clean power supply should power both the DM6435 device and the external clock oscillator circuit. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see [Section 6.7.4, Clock PLL Electrical Data/Timing \(Input and Output Clocks\)](#).

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the device requirements in this data manual (see [Section 5.3, Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature](#) and [Section 6.7.4, Clock PLL Electrical Data/Timing \(Input and Output Clocks\)](#)).

6.7.4 Clock PLL Electrical Data/Timing (Input and Output Clocks)

Table 6-19. Timing Requirements for MXI/CLKIN ⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾ (see Figure 6-12)

NO.			-7I-6I-5I-4 -LJ-Q6I-Q5I-Q4		UNIT
			MIN	MAX	
1	$t_{c(MXI)}$	Cycle time, MXI/CLKIN	33.3	50	ns
2	$t_{w(MXI)H}$	Pulse duration, MXI/CLKIN high	0.45C	0.55C	ns
3	$t_{w(MXI)L}$	Pulse duration, MXI/CLKIN low	0.45C	0.55C	ns
4	$t_t(MXI)$	Transition time, MXI/CLKIN		0.05C	ns
5	$t_J(MXI)$	Period jitter, MXI/CLKIN		0.02C	ns
		Frequency Stability		±50	ppm

- (1) The MXI/CLKIN frequency and PLL multiply factor should be chosen such that the resulting clock frequency is within the specific range for CPU operating frequency. For example, for a -6 speed device with a 27 MHz CLKIN frequency, the PLL multiply factor should be ≤ 22 .
- (2) The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.
- (3) For more details on the PLL multiplier factors, see the *TMS320DM63x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).
- (4) C = CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use $C = 37.037$ ns.

3	$t_{w(CLKOUT0)L}$	Pulse duration, CLKOUT0 low	0.45P	0.55P	ns
4	$t_t(CLKOUT0)$	Transition time, CLKOUT0		0.05P	ns

- (1) The reference points for the rise and fall transitions are measured at V_{OL} MAX and V_{OH} MIN.
- (2) P = 1/CLKOUT0 clock frequency in nanoseconds (ns). For example, when CLKOUT0 frequency is 27 MHz, use P = 37.04 ns.

Figure 6-13. CLKOUT0 Timing

6.8 Interrupts

The C64x+ DSP interrupt controller combines device events into 12 prioritized interrupts. The source for each of the 12 CPU interrupts is user programmable and is listed in [Table 6-21](#). Also, the interrupt controller controls the generation of the CPU exception and emulation interrupts. The NMI input to the C64x+ DSP interrupt controller is not connected internally; therefore, the NMI interrupt is not available. [Table 6-22](#) summarizes the C64x+ interrupt controller registers and memory locations. For more details on DSP interrupt controller, see the *TMS320DM643x DMP DSP Subsystem Reference Guide* (literature number [SPRU978](#)).

6.9 External Memory Interface (EMIF)

DM6435 supports several memory and external device interfaces, including:

- Asynchronous EMIF (EMIFA) for interfacing to NOR Flash, SRAM, etc.
- NAND Flash

6.9.1 Asynchronous EMIF (EMIFA)

The DM6435 Asynchronous EMIF (EMIFA) provides an 8-bit data bus, an address bus width up to 24-bits, and 4 chip selects, along with memory control signals. These signals are multiplexed between these peripherals:

- EMIFA and NAND interfaces
- VPFE (CCDC)
- GPIO

6.9.2 NAND (NAND, SmartMedia, xD)

The EMIFA interface provides both the asynchronous EMIF and NAND interfaces. Four chip selects are provided and each are individually configurable to provide either EMIFA or NAND support. The NAND features supported are as follows.

- NAND flash on up to 4 asynchronous chip selects.
- 8-bit data bus width
- Programmable cycle timings.
- Performs ECC calculation.
- NAND Mode also supports SmartMedia and xD memory cards
- Boot ROM supports booting of the DM6435 from NAND flash located at CS2

The memory map for EMIFA and NAND registers is shown in [Table 6-23](#). For more details on the EMIFA and NAND interfaces, see [Section 2.9, Documentation Support](#) for the link to the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number [SPRU983](#)) for the *TMS320DM643x Asynchronous External Memory Interface (EMIF) User's Guide* (literature number [SPRU984](#)).

6.9.3 EMIFA Electrical Data/Timing

Table 6-24. Timing Requirements for Asynchronous Memory Cycles for EMIFA Module⁽¹⁾
(see [Figure 6-14](#) and [Figure 6-15](#))

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4			UNIT
			MIN	NOM	MAX	
READS and WRITES						
2	$t_{w(EM_WAIT)}$	Pulse duration, EM_WAIT assertion and deassertion	2E			ns
READS						
12	$t_{su(EMDV-EMOEH)}$	Setup time, EM_D[7:0] valid before $\overline{EM_OE}$ high	5			ns
13	$t_{h(EMOEH-EMDIV)}$	Hold time, EM_D[7:0] valid after $\overline{EM_OE}$ high	0			ns
14	$t_{su(EMWAIT-EMOEH)}$	Setup time, EM_WAIT asserted before $\overline{EM_OE}$ high ⁽²⁾	4E + 5			ns
WRITES						
28	$t_{su(EMWAIT-EMWEH)}$	Setup time, EM_WAIT asserted before $\overline{EM_WE}$ high ⁽²⁾	4E + 5			ns

- (1) E = SYSCLK3 period in ns for EMIFA. For example, when running the DSP CPU at 600 MHz, use E = 10 ns.
- (2) Setup before end of STROBE phase (if no extended wait states are inserted) by which EM_WAIT must be asserted to add extended wait states. [Figure 6-16](#) and [Figure 6-17](#) describe EMIF transactions that include extended wait states inserted during the STROBE phase. However, cycles inserted as part of this extended wait period should not be counted; the 4E requirement is to the start of where the HOLD phase would begin if there were no extended wait cycles.

Table 6-25. Switching Characteristics Over Recommended Operating Conditions for Asynchronous Memory Cycles for EMIFA Module⁽¹⁾⁽²⁾ (see Figure 6-14 and Figure 6-15)

16	t_{su} (EMCSL-EMWEL) Output setup time, $\overline{EM_CS}[5:2]$ low to $\overline{EM_WE}$ low (SS = 0)	(WS + 1) * E - 4		(WS + 1) * E + 4	ns
		-4		4	ns
17	t_h (EMWEH-EMCSH) Output hold time, $\overline{EM_WE}$ high to $\overline{EM_CS}[5:2]$ high (SS = 0)	(WH + 1) * E - 4		(WH + 1) * E + 4	ns
		-4		4	ns
18	t_{su} (EMRNW-EMWEL) Output setup time, $\overline{EM_R/W}$ valid to $\overline{EM_WE}$ low	(WS + 1) * E - 4		(WS + 1) * E + 4	ns
19	t_h (EMWEH-EMRNW) Output hold time, $\overline{EM_WE}$ high to $\overline{EM_R/W}$ invalid	(WH + 1) * E - 4		(WH + 1) * E + 4	ns
20	t_{su} (EMBAV-EMWEL) Output setup time, $\overline{EM_BA}[1:0]$ valid to $\overline{EM_WE}$ low	(WS + 1) * E - 4		(WS + 1) * E + 4	ns
21	t_h (EMWEH-EMBAIV) Output hold time, $\overline{EM_WE}$ high to $\overline{EM_BA}[1:0]$ invalid	(WH + 1) * E - 4		(WH + 1) * E + 4	ns
22	t_{su} (EMAV-EMWEL) Output setup time, $\overline{EM_A}[21:0]$ valid to $\overline{EM_WE}$ low	(WS + 1) * E - 4		(WS + 1) * E + 4	ns
23	t_h (EMWEH-EMAV) Output hold time, $\overline{EM_WE}$ high to $\overline{EM_A}[21:0]$ invalid	(WH + 1) * E - 4		(WH + 1) * E + 4	ns

(1) RS = Read setup, RST = Read STrobe, RH = Read Hold, WS = Write Setup, WST = Write STrobe, WH = Write Hold, TA = Turn Around, EW = Extend Wait mode, SS = Select Strobe mode. These parameters are programmed via the Asynchronous *n* Configuration and Asynchronous Wait Cycle Configuration Registers.

(2) E = SYSCLK3 period in ns for EMIFA. For example, when running the DSP CPU at 600 MHz, use E = 10 ns.

(3) When EW = 1, the EMIF will extend the strobe period up to 4,096 additional cycles when the EM_WAIT pin is asserted by the external device.

Table 6-25. Switching Characteristics Over Recommended Operating Conditions for Asynchronous Memory Cycles for EMIFA Module (see Figure 6-14 and Figure 6-15) (continued)

6.9.4 DDR2 Memory Controller

The DDR2 Memory Controller is a dedicated interface to DDR2 SDRAM. It supports JESD79D-2A standard compliant DDR2 SDRAM Devices and can interface to either 16-bit or 32-bit DDR2 SDRAM devices. For details on the DDR2 Memory Controller, see [Section 2.9, Document Support](#) for the link to the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number SPRU983) for the *TMS320C642x/DM643x DMP DDR2 Memory Controller User's Guide* (literature number SPRU986).

DDR2 SDRAM plays a key role in a DaVinci-based system. Such a system is expected to require a significant amount of high-speed external memory for:

- Buffering of input image data from sensors or video sources
- Intermediate buffering for processing/resizing of image data in the VPFE
- Intermediate buffering for large raw Bayer data image files while performing image processing functions
- Buffering for intermediate data while performing video encode and decode functions
- Storage of executable code for the DSP

A memory map of the DDR2 Memory Controller registers is shown in [Table 6-26](#).

Table 6-26. DDR2 Memory Controller Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME

6.9.4.1 DDR2 Memory Controller Electrical Data/Timing

The *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number [SPRAAL6](#)) specifies a complete DDR2 interface solution for the DM6435 as well as a list of compatible DDR2 devices. TI has performed the simulation and system characterization to ensure all DDR2 interface timings in this solution are met.

TI only supports board designs that follow the guidelines outlined in the *Implementing DDR2 PCB Layout on the TMS320DM643x DMP DMSoC* Application Report (literature number [SPRAAL6](#)).

Table 6-27. Switching Characteristics Over Recommended Operating Conditions for DDR2 Memory Controller⁽¹⁾⁽²⁾(see [Figure 6-18](#))

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
1	$t_{c(DDR_CLK)}$ Cycle time, DDR_CLK	6	8	ns

(1) DDR_CLK cycle time = 2 x PLL2 _SYSCLK1 cycle time.

(2) The PLL2 Controller **must** be programmed such that the resulting DDR_CLK clock frequency is within the specified range.

Figure 6-18. DDR2 Memory Controller Clock Timing

6.10 Video Processing Sub-System (VPSS) Overview

The DM6435 Video Processing Sub-System (VPSS) provides a Video Processing Front End (VPFE) input interface for external imaging peripherals (i.e., image sensors, video decoders, etc.); the DM6435 VPSS **does not** support a Video Processing Back End (VPBE) output interface.

The VPSS register memory mapping is shown in [Table 6-28](#).

Table 6-28. VPSS Register Descriptions

HEX ADDRESS RANGE	REGISTER ACRONYM	Description
0x01C7 3400	PID	Peripheral Revision and Class Information
0x01C7 3404	PCR	VPSS Control Register
0x01C7 3408	-	Reserved
0x01C7 3508	SDR_REG_EXP	SDRAM Non Real-Time Read Request Expand
0x01C7 350C - 0x01C7 3FFF	-	Reserved

6.10.1 Video Processing Front-End (VPFE)

The Video Processing Front-End (VPFE) consists of the CCD Controller (CCDC), Preview Engine, Resizer, Hardware 3A (H3A) Statistic Generator, and Histogram blocks. Together, these modules provide DM6435 with a powerful and flexible front-end interface. These modules are briefly described below:

- The CCDC provides an interface to image sensors and digital video sources.
- The Preview Engine is a parameterized hardwired image processing block which is used for converting RAW color data from a Bayer pattern to YUV 4:2:2.
- The Resizer module re-sizes the input image data to the desired display or video encoding resolution.
- The H3A module provides control loops for Auto Focus (AF), Auto White Balance (AWB) and Auto Exposure (AE).
- The Histogram module bins input color pixels, depending on the amplitude, and provides statistics required to implement various 3A (AE/AF/AWB) algorithms and tune the final image/video output.

The VPFE register memory mapping is shown in [Table 6-29](#).

Table 6-29. VPFE Register Address Range Descriptions

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x01C7 0400 – 0x01C7 07FF	CCDC	VPFE – CCD Controller
0x01C7 0800 – 0x01C7 0BFF	PREV	VPFE – Preview Engine/Image Signal Processor
0x01C7 0C00 – 0x01C7 09FF	RESZ	VPFE – Resizer
0x01C7 1000 – 0x01C7 13FF	HIST	VPFE – Histogram
0x01C7 1400 – 0x01C7 17FF	H3A	VPFE – Hardware 3A (Auto-Focus/WB/Exposure)
0x01C7 3400 – 0x01C7 3FFF	VPSS	VPSS Shared Buffer Logic Registers

6.10.1.1 CCD Controller (CCDC)

The CCDC receives raw image/video data from sensors (CMOS or CCD) or YUV video data in numerous formats from video decoder devices. The following features are supported by the CCDC module.

- Conventional Bayer pattern format.
- Generates HD/VD timing signals and field ID to an external timing generator or can synchronize to an external timing generator.
- Interface to progressive and interlaced sensors.
- REC656/CCIR-656 standard (YCbCr 4:2:2 format, either 8- or 16-bit).
- YCbCr 4:2:2 format, either 8- or 16-bit with discrete H and VSYNC signals.
- Up to 16-bit input.

- Optical black clamping signal generation.
- Shutter signal control.
- Digital clamping and black level compensation.
- 10-bit to 8-bit A-law compression.
- Low-pass filter prior to writing to SDRAM. If this filter is enabled, 2 pixels each in the left and right edges of each line are cropped from the output.
- Output range from 16-bits to 8-bits wide (8-bits wide allows for 50% saving in storage area).
- Downsampling via programmable culling patterns.
- Control output to the DDR2 via an external write enable signal.
- Up to 16K pixels (image size) in both the horizontal and vertical direction.

The CCDC register memory mapping is shown in [Table 6-30](#).

6.10.1.2 Preview Engine

The preview engine transforms raw unprocessed image/video data from a sensor (CMOS or CCD) into YCbCr 4:2:2 data. The output of the preview engine is used for both video compression and external display devices such as a NTSC/PAL analog encoder or a digital LCD. The following features are supported by the preview engine.

- Accepts conventional Bayer pattern formats.
- Input image/video data from either the CCD/CMOS controller or the DDR2 memory.
- Output width up to 1280 pixels wide.
- Automatic/mandatory cropping of pixels/lines when edge processing is performed. If all the corresponding modules are enabled, a total of 14 pixels per line (7 left most and 7 right most) and 8 lines (4 top most and 4 bottom most) will not be output.
- Simple horizontal averaging (by factors of 2, 4, or 8) to handle input widths that are greater than 1280 (plus the cropped number) pixels wide.
- Dark frame capture to DDR2.
- Dark frame subtraction for every input raw data frame, fetched from DDR2, pixel-by-pixel to improve video quality.
- Lens shading compensation. Each input pixel is multiplied with a corresponding 8-bit gain value and the result is right shifted by a programmable parameter (0-7 bits).
- A-law decompression to transform non-linear 8-bit data to 10-bit linear data. This feature allows data in DDR2 to be 8-bits, which saves 50% of the area if the input to the preview engine is from the DDR2.
- Horizontal median filter for reducing temperature induced noise in pixels.
- Programmable noise filter that operates on a 3x3 grid of the same color (effectively, this is a five line storage requirement).
- Digital gain and white balance (color separate gain for white balance).
- Programmable CFA interpolation that operates on a 5x5 grid.
- Conventional Bayer pattern RGB and complementary color sensors.
- Support for an image that is downsampled by 2x in the horizontal direction (with and without phase correction). In this case, the image is 2/3 populated instead of the conventional 1/3 colors.
- Support for an image that is downsampled by 2x in both the horizontal and vertical direction. In this case, the image is fully populated instead of the conventional 1/3 colors.
- Programmable RGB-to-RGB blending matrix (9 coefficients for the 3x3 matrix).
- Fully programmable gamma correction (1024 entries for each color held in an on-chip RAM).
- Programmable color conversion (RGB to YUV) coefficients (9 coefficients for the 3x3 matrix).
- Luminance enhancement (non-linear) and chrominance suppression & offset.

The Preview Engine register memory mapping is shown in [Table 6-31](#).

6.10.1.3 Resizer

The resizer module can accept input image/video data from either the preview engine or DDR2. The output of the resizer module is sent to DDR2. The following features are supported by the resizer module.

- An output width up to 1280 horizontal pixels.
- Input from external DDR2.
- Up to 4x upsampling (digital zoom).
- Bi-cubic interpolation (4-tap horizontal, 4-tap vertical) can be implemented with the programmable filter coefficients.
- 8 phases of filter coefficients.
- Optional bi-linear interpolation for the chrominance components.
- Up to 1/4x downsampling
- 4-tap horizontal and 4-tap vertical filter coefficients (with 8-phases) for 1x to 1/2x downsampling
- 1/2x to 1/4x downsampling, for 7-tap mode with 4-phases.
- Resizing either YUV 4:2:2 packed data (16-bits) or color separate data (8-bit data within DDR) that is contiguous.

- Separate/independent resizing factor for the horizontal and vertical directions.
- Upsampling and downsampling ratios that are available are: 256/N, with N ranging from 64 to 1024.
- Programmable luminance sharpening after the horizontal resizing and before the vertical resizing step.

The Resizer register memory mapping is shown in [Table 6-32](#).

Table 6-32. Resizer Register Descriptions

6.10.1.4 Hardware 3A (H3A)

The Hardware 3A (H3A) module provides control loops for Auto Focus, Auto White Balance and Auto Exposure. There are 2 main components of the H3A module:

- Auto Focus (AF) Engine
- Auto Exposure (AE) & Auto White Balance (AWB) Engine

The AF engine extracts and filters the red, green, and blue data from the input image/video data and provides either the accumulation or peaks of the data in a specified region. The specified region is a two dimensional block of data and is referred to as a “paxel” for the case of AF.

The AE/AWB Engine accumulates the values and checks for saturated values in a sub sampling of the video data. In the case of the AE/AWB, the two-dimensional block of data is referred to as a “window”. The number, dimensions, and starting position of the AF paxels and the AE/AWB windows are separately programmable.

The H3A register memory mapping is shown in [Table 6-33](#).

Table 6-33. H3A Register Descriptions

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION

0x01C7 145C	AEWBUFST	SDRAM/DDRAM Start Address for AE/AWB Engine

6.10.1.4.1 Auto Focus (AF) Engine

The following features are supported by the Auto Focus (AF) Engine.

- Peak Mode in a Paxel (a Paxel is defined as a two dimensional block of pixels).
- Accumulate the maximum Focus Value of each line in a Paxel

- Accumulation/Sum Mode (instead of Peak mode).
- Accumulate Focus Value in a Poxel.
- Up to 36 Poxels in the horizontal direction and up to 128 Poxels in the vertical direction.
- Programmable width and height for the Poxel. All paxels in the frame will be of same size.
- Programmable red, green, and blue position within a 2x2 matrix.
- Separate horizontal start for poxel and filtering.
- Programmable vertical line increments within a poxel.
- Parallel IIR filters configured in a dual-biquad configuration with individual coefficients (2 filters with 11 coefficients each). The filters are intended to compute the sharpness/peaks in the frame to focus on.

6.10.1.4.2 Auto Exposure (AE) and Auto White Balance (AWB) Engine

The following features are supported by the Auto Exposure (AE) and Auto White Balance (AWB) Engine.

- Accumulate clipped pixels along with all non-saturated pixels.
- Up to 36 horizontal windows.
- Up to 128 vertical windows.
- Programmable width and height for the windows. All windows in the frame will be of same size.
- Separate vertical start coordinate and height for a black row of paxels that is different than the remaining color paxels.
- Programmable Horizontal Sampling Points in a window.
- Programmable Vertical Sampling Points in a window.

6.10.1.5 Histogram

The histogram module accepts raw image/video data and bins the pixels on a value (and color separate) basis. The value of the pixel itself is not stored, but each bin contains the number of pixels that are within the appropriate set range. The source of the raw data for the histogram is typically a CCD/CMOS sensor (via the CCDC module) or optionally from DDR2. The following features are supported by the histogram module.

- Up to four regions/areas.
- Separate horizontal/vertical start and end position for each region.
- Pixels from overlapping regions are accumulated into the highest priority region. The priority is: region0 > region1 > region2 > region3.
- Interface to conventional Bayer pattern. Each region can accumulate either 3 or 4 colors.
- 32, 64, 128, or 256 bins per color per region.
- 32, 64, or 128 bins per color for 2 regions.
- 32 or 64 bins per color for 3 or 4 regions.
- Automatic clear of histogram RAM after an ARM read.
- Saturation of the pixel count if the count exceeds the maximum value (each memory location is 20-bit wide).
- Downshift ranging from 0 to 7 bits (maximum bin range 128).
- The last bin (highest range of values) will accumulate any value that is higher than the lower bound.

The Histogram register memory mapping is shown in [Table 6-34](#).

6.11 Universal Asynchronous Receiver/Transmitter (UART)

DM6435 has 2 UART peripherals. Each UART has the following features:

- 16-byte storage space for both the transmitter and receiver FIFOs
- 1, 4, 8, or 14 byte selectable receiver FIFO trigger level for autoflow control and DMA
- DMA signaling capability for both received and transmitted data
- Programmable auto-rts and auto-cts for autoflow control
- Frequency pre-scale values from 1 to 65,535 to generate appropriate baud rates
- Prioritized interrupts
- Programmable serial data formats
 - 5, 6, 7, or 8-bit characters
 - Even, odd, or no parity bit generation and detection
 - 1, 1.5, or 2 stop bit generation
- False start bit detection
- Line break generation and detection
- Internal diagnostic capabilities
 - Loopback controls for communications link fault isolation
 - Break, parity, overrun, and framing error simulation
- Modem control functions (CTS, RTS) on **UART0 only**.

The UART0/1 registers are listed in [Table 6-39](#) and [Table 6-40](#).

6.11.2 UART Electrical Data/Timing

Table 6-41. Timing Requirements for UARTx Receive⁽¹⁾ (see Figure 6-23)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
4	$t_{w(URXDB)}$	Pulse duration, receive data bit (URXDx) [15/30/100 pF]	0.96U	1.05U	ns
5	$t_{w(URXSB)}$	Pulse duration, receive start bit [15/30/100 pF]	0.96U	1.05U	ns

(1) U = UART baud time = 1/programmed baud rate.

Table 6-42. Switching Characteristics Over Recommended Operating Conditions for UARTx Transmit⁽¹⁾ (see Figure 6-23)

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT		
		MIN	MAX			
1	$f_{(baud)}$	Maximum programmable baud rate		128	kHz	
2	$t_{w(UTXDB)}$	Pulse duration, transmit data bit (UTXDx) [15/30/100 pF]		U - 2	U + 2	ns
3	$t_{w(UTXSB)}$	Pulse duration, transmit start bit [15/30/100 pF]		U - 2	U + 2	ns

(1) U = UART baud time = 1/programmed baud rate.

Figure 6-23. UART Transmit/Receive Timing

6.12 Inter-Integrated Circuit (I2C)

The inter-integrated circuit (I2C) module provides an interface between DM6435 and other devices compliant with Philips Semiconductors Inter-IC bus (I²C-bus™) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the DSP through the I2C module. The I2C port *does not* support CBUS compatible devices.

The I2C port supports:

- Compatible with Philips I2C Specification Revision 2.1 (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise Filter to Remove Noise 50 ns or less
- Seven- and Ten-Bit Device Addressing Modes
- Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- Slew-Rate Limited Open-Drain Output Buffers

Figure 6-24. I2C Module Block Diagram

For more detailed information on the I2C peripheral, see [Section 2.9, Documentation Support](#) section of this document for the *TMS320DM643x DMP Peripherals Overview Reference Guide* (literature number SPRU983).

6.12.1 I2C Peripheral Register Description(s)

Table 6-43. I2C Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x1C2 1000	ICOAR	I2C Own Address Register
0x1C2 1004	ICIMR	I2C Interrupt Mask Register
0x1C2 1008	ICSTR	I2C Interrupt Status Register
0x1C2 100C	ICCLKL	I2C Clock Divider Low Register
0x1C2 1010	ICCLKH	I2C Clock Divider High Register
0x1C2 1014	ICCNT	I2C Data Count Register
0x1C2 1018	ICDRR	I2C Data Receive Register
0x1C2 101C	ICSAR	I2C Slave Address Register
0x1C2 1020	ICDXR	I2C Data Transmit Register

0x1C2 1030	ICPSC	I2C Prescaler Register
0x1C2 1034	ICPID1	I2C Peripheral Identification Register 1
0x1C2 1038	ICPID2	I2C Peripheral Identification Register 2

6.12.2 I2C Electrical Data/Timing

6.12.2.1 Inter-Integrated Circuits (I2C) Timing

Table 6-44. Timing Requirements for I2C Timings⁽¹⁾ (see Figure 6-25)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4				UNIT
			STANDARD MODE		FAST MODE		
			MIN	MAX	MIN	MAX	
1	$t_{c(SCL)}$	Cycle time, SCL	10		2.5		μ s
2	$t_{su(SCLH-SDAL)}$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		μ s
3	$t_{h(SCLL-SDAL)}$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		μ s
4	$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		1.3		μ s
5	$t_{w(SCLH)}$	Pulse duration, SCL high	4		0.6		μ s
6	$t_{su(SDAV-SCLH)}$	Setup time, SDA valid before SCL high	250		100 ⁽²⁾		ns
7	$t_{h(SDA-SCLL)}$	Hold time, SDA valid after SCL low	0 ⁽³⁾		0 ⁽³⁾	0.9 ⁽⁴⁾	μ s
8	$t_{w(SDAH)}$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μ s
9	$t_{r(SDA)}$	Rise time, SDA		1000	$20 + 0.1C_b$ ⁽⁵⁾	300	ns
10	$t_{r(SCL)}$	Rise time, SCL		1000	$20 + 0.1C_b$ ⁽⁵⁾	300	ns
11	$t_{f(SDA)}$	Fall time, SDA		300	$20 + 0.1C_b$ ⁽⁵⁾	300	ns
12	$t_{f(SCL)}$	Fall time, SCL		300	$20 + 0.1C_b$ ⁽⁵⁾	300	ns
13	$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		μ s
14	$t_{w(SP)}$	Pulse duration, spike (must be suppressed)			0	50	ns
15	C_b ⁽⁵⁾	Capacitive load for each bus line		400		400	pF

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) A Fast-mode I²C-bus™ device can be used in a Standard-mode I²C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_r \text{ max} + t_{su(SDA-SCLH)} = 1000 + 250 = 1250$ ns (according to the Standard-mode I²C-Bus Specification) before the SCL line is released.
- (3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (4) The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the low period [$t_{w(SCLL)}$] of the SCL signal.
- (5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

Figure 6-25. I2C Receive Timings

Table 6-45. Switching Characteristics for I2C Timings⁽¹⁾ (see Figure 6-26)

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4				UNIT
		STANDARD MODE		FAST MODE		
		MIN	MAX	MIN	MAX	
16	$t_{c(SCL)}$ Cycle time, SCL	10		2.5		μs
17	$t_{d(SCLH-SDAL)}$ Delay time, SCL high to SDA low (for a repeated START condition)	4.7		0.6		μs
18	$t_{d(SDAL-SCLL)}$ Delay time, SDA low to SCL low (for a START and a repeated START condition)	4		0.6		μs
19	$t_{w(SCLL)}$ Pulse duration, SCL low	4.7		1.3		μs
20	$t_{w(SCLH)}$ Pulse duration, SCL high	4		0.6		μs
21	$t_{d(SDAV-SCLH)}$ Delay time, SDA valid to SCL high	250		100		ns
22	$t_{v(SCLL-SDAV)}$ Valid time, SDA valid after SCL low	0		0	0.9	μs
23	$t_{w(SDAH)}$ Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μs
24	$t_{r(SDA)}$ Rise time, SDA		1000	$20 + 0.1C_b^{(1)}$	300	ns
25	$t_{r(SCL)}$ Rise time, SCL		1000	$20 + 0.1C_b^{(1)}$	300	ns
26	$t_{f(SDA)}$ Fall time, SDA		300	$20 + 0.1C_b^{(1)}$	300	ns
27	$t_{f(SCL)}$ Fall time, SCL		300	$20 + 0.1C_b^{(1)}$	300	ns
28	$t_{d(SCLH-SDAH)}$ Delay time, SCL high to SDA high (for STOP condition)	4		0.6		μs
29	C_p Capacitance for each I2C pin		10		10	pF

(1) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

Figure 6-26. I2C Transmit Timings

6.13 Host-Port Interface (HPI) Peripheral

6.13.1 HPI Device-Specific Information

The DM6435 device includes a user-configurable 16-bit Host-port interface (HPI16).

Software handshaking via the HRDY bit of the Host Port Control Register (HPIC) is **not** supported on the DM6435.

The DM6435 HPI does **not** support the $\overline{\text{HAS}}$ feature. For proper device operation, the $\overline{\text{HAS}}$ pin **must** be pulled up via an external resistor.

6.13.2 HPI Peripheral Register Description(s)

Table 6-46. HPI Control Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
01C6 7800	PID	Peripheral Identification Register	
01C6 7804	PWREMU_MGMT	HPI power and emulation management register	The CPU has read/write access to the PWREMU_MGMT register.
01C6 7808 - 01C6 7824	-	Reserved	
01C6 7828	-	Reserved	
01C6 782C	-	Reserved	
01C6 7830	HPIC	HPI control register	The Host and the CPU both have read/write access to the HPIC register.
01C6 7834	HPIA (HPIAW) ⁽¹⁾	HPI address register (Write)	The Host has read/write access to the HPIA registers. The CPU has only read access to the HPIA registers.
01C6 7838	HPIA (HPIAR) ⁽¹⁾	HPI address register (Read)	
01C6 780C - 01C6 7FFF	-	Reserved	

(1) There are two 32-bit HPIA registers: HPIAR for read operations and HPIAW for write operations. The HPI can be configured such that HPIAR and HPIAW act as a single 32-bit HPIA (single-HPIA mode) or as two separate 32-bit HPIAs (dual-HPIA mode) from the perspective of the Host. The CPU can access HPIAW and HPIAR independently. For more details about the HPIA registers and their modes, see the *TMS320C643x DMP Host Port Interface (HPI) User's Guide* (literature number [SPRU998](#)).

6.13.3 HPI Electrical Data/Timing

Table 6-47. Timing Requirements for Host-Port Interface Cycles⁽¹⁾⁽²⁾ (see [Figure 6-27](#) and [Figure 6-28](#))

NO.		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
1	$t_{su}(SELV-HSTBL)$ Setup time, select signals ⁽³⁾ valid before $\overline{HSTROBE}$ low	5		ns
2	$t_h(HSTBL-SELV)$ Hold time, select signals ⁽³⁾ valid after $\overline{HSTROBE}$ low	2		ns
3	$t_w(HSTBL)$ Pulse duration, $\overline{HSTROBE}$ active low	15		ns
4	$t_w(HSTBH)$ Pulse duration, $\overline{HSTROBE}$ inactive high between consecutive accesses	2M		ns
11	$t_{su}(HDV-HSTBH)$ Setup time, host data valid before $\overline{HSTROBE}$ high	5		ns
12	$t_h(HSTBH-HDV)$ Hold time, host data valid after $\overline{HSTROBE}$ high	0		ns
13	$t_h(HRDYL-HSTBL)$ Hold time, $\overline{HSTROBE}$ high after \overline{HRDY} low. $\overline{HSTROBE}$ should not be inactivated until \overline{HRDY} is active (low); otherwise, HPI writes will not complete properly.	0		ns

(1) $\overline{HSTROBE}$ refers to the following logical operation on \overline{HCS} , $\overline{HDS1}$, and $\overline{HDS2}$: $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$.

(2) $M = \text{SYSCLK3 period} = (\text{CPU clock frequency})/6$ in ns. For example, when running parts at 600 MHz, use 10 ns.

(3) Select signals include: $\text{HCNTL}[1:0]$, $\text{HR}/\overline{\text{W}}$ and HHWIL .

Table 6-48. Switching Characteristics for Host-Port Interface Cycles⁽¹⁾⁽²⁾⁽³⁾
(see Figure 6-27 and Figure 6-28)

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT	
			MIN	MAX		
5	$t_{d(HSTBL-HRDYV)}$	Delay time, $\overline{HSTROBE}$ low to \overline{HRDY} valid	<p>For HPI Write, \overline{HRDY} can go high (<i>not ready</i>) for these HPI Write conditions; otherwise, \overline{HRDY} stays low (<i>ready</i>): Case 1: Back-to-back HPIA writes (can be either first or second half-word) Case 2: HPIA write following a PREFETCH command (can be either first or second half-word) Case 3: HPID write when FIFO is full or flushing (can be either first or second half-word) Case 4: HPIA write and Write FIFO not empty</p> <p>For HPI Read, \overline{HRDY} can go high (<i>not ready</i>) for these HPI Read conditions: Case 1: HPID read (with auto-increment) and data not in Read FIFO (can only happen to first half-word of HPID access) Case 2: First half-word access of HPID Read without auto-increment</p> <p>For HPI Read, \overline{HRDY} stays low (<i>ready</i>) for these HPI Read conditions: Case 1: HPID read with auto-increment and data is already in Read FIFO (applies to either half-word of HPID access) Case 2: HPID read without auto-increment and data is already in Read FIFO (always applies to second half-word of HPID access) Case 3: HPIC or HPIA read (applies to either half-word access)</p>		12	ns
6	$t_{en(HSTBL-HD)}$	Enable time, HD driven from $\overline{HSTROBE}$ low	2		ns	
7	$t_{d(HRDYL-HDV)}$	Delay time, \overline{HRDY} low to HD valid	0		ns	
8	$t_{oh(HSTBH-HDV)}$	Output hold time, HD valid after $\overline{HSTROBE}$ high	1.5		ns	
14	$t_{dis(HSTBH-HDV)}$	Disable time, HD high-impedance from $\overline{HSTROBE}$ high	12		ns	
15	$t_{d(HSTBL-HDV)}$	Delay time, $\overline{HSTROBE}$ low to HD valid	<p>For HPI Read. Applies to conditions where data is already residing in HPID/FIFO: Case 1: HPIC or HPIA read Case 2: First half-word of HPID read with auto-increment and data is already in Read FIFO Case 3: Second half-word of HPID read with or without auto-increment</p>		15	ns
18	$t_{d(HSTBH-HRDYV)}$	Delay time, $\overline{HSTROBE}$ high to \overline{HRDY} valid	<p>For HPI Write, \overline{HRDY} can go high (<i>not ready</i>) for these HPI Write conditions; otherwise, \overline{HRDY} stays low (<i>ready</i>): Case 1: HPID write when Write FIFO is full (can happen to either half-word) Case 2: HPIA write (can happen to either half-word) Case 3: HPID write without auto-increment (only happens to second half-word)</p>		12	ns

(1) $M = \text{SYSCLK3 period} = (\text{CPU clock frequency})/6$ in ns. For example, when running parts at 600 MHz, use 10 ns.
(2) $\overline{HSTROBE}$ refers to the following logical operation on HCS, HDS1, and HDS2: $[\text{NOT}(\text{HDS1 XOR HDS2})] \text{ OR HCS}$.
(3) By design, whenever HCS is driven inactive (high), HPI will drive \overline{HRDY} active (low).

- A. $\overline{HSTROBE}$ refers to the following logical operation on \overline{HCS} , $\overline{HDS1}$, and $\overline{HDS2}$: $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on \overline{HRDY} may or may not occur.
For more detailed information on the HPI peripheral, see the *TMS320DM643x Host Port Interface (HPI) User's Guide* (literature number SPRU998).
- C. \overline{HCS} reflects typical \overline{HCS} behavior when $\overline{HSTROBE}$ assertion is caused by $\overline{HDS1}$ or $\overline{HDS2}$. \overline{HCS} timing requirements are reflected by parameters for $\overline{HSTROBE}$.
- D. For proper HPI operation, \overline{HAS} must be pulled up via an external resistor.

Figure 6-27. HPI16 Read Timing (\overline{HAS} Not Used, Tied High)

- A. $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on $\overline{\text{HRDY}}$ may or may not occur.
For more detailed information on the HPI peripheral, see the *TMS320DM643x Host Port Interface (HPI) User's Guide* (literature number SPRU998).
- C. $\overline{\text{HCS}}$ reflects typical $\overline{\text{HCS}}$ behavior when $\overline{\text{HSTROBE}}$ assertion is caused by $\overline{\text{HDS1}}$ or $\overline{\text{HDS2}}$. $\overline{\text{HCS}}$ timing requirements are reflected by parameters for $\overline{\text{HSTROBE}}$.
- D. For proper HPI operation, $\overline{\text{HAS}}$ must be pulled up via an external resistor.

Figure 6-28. HPI16 Write Timing ($\overline{\text{HAS}}$ Not Used, Tied High)

6.14 Multichannel Buffered Serial Port (McBSP)

The McBSP provides these functions:

- Full-duplex communication
- Double-buffered data registers, which allow a continuous data stream
- Independent framing and clocking for receive and transmit
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected analog-to-digital (A/D) and digital-to-analog (D/A) devices
- External shift clock or an internal, programmable frequency shift clock for data transfer

If internal clock source is used, the CLKGDV field of the Sample Rate Generator Register (SRGR) must always be set to a value of 1 or greater.

For more detailed information on the McBSP peripheral, see the *TMS320DM643x DMP Multichannel Buffered Serial Port (McBSP) User's Guide* (literature number [SPRU943](#)).

6.14.1 McBSP Peripheral Register Description(s)

Table 6-49. McBSP 0 Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
01D0 0000	DRR0	McBSP0 Data Receive Register	The CPU and EDMA3 controller can only read this register; they cannot write to it.

01D0003C	XCERE30	McBSP0 Enhanced Transmit Channel Enable Register 3 Partition G/H	
01D0 0040 - 01D0 07FF	-	Reserved	

6.14.2 McBSP Electrical Data/Timing

6.14.2.1 Multichannel Buffered Serial Port (McBSP) Timing

Table 6-50. Timing Requirements for McBSP⁽¹⁾ (see Figure 6-29)

NO.				-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
				MIN	MAX	
2	$t_{c(CKRX)}$	Cycle time, CLKR/X	CLKR/X ext	2P ⁽²⁾⁽³⁾		ns
3	$t_{w(CKRX)}$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	P - 1 ⁽⁴⁾		ns
5	$t_{su(FRH-CKRL)}$	Setup time, external FSR high before CLKR low	CLKR int	14		ns
			CLKR ext	4		
6	$t_{h(CKRL-FRH)}$	Hold time, external FSR high after CLKR low	CLKR int	6		ns
			CLKR ext	4		
7	$t_{su(DRV-CKRL)}$	Setup time, DR valid before CLKR low	CLKR int	14		ns
			CLKR ext	4		
8	$t_{h(CKRL-DRV)}$	Hold time, DR valid after CLKR low	CLKR int	3		ns
			CLKR ext	3.5		
10	$t_{su(FXH-CKXL)}$	Setup time, external FSX high before CLKX low	CLKX int	14		ns
			CLKX ext	4		
11	$t_{h(CKXL-FXH)}$	Hold time, external FSX high after CLKX low	CLKX int	6		ns
			CLKX ext	3		

- (1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) P = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use P = 10 ns.
- (3) Use whichever value is greater. Minimum CLKR/X cycle times *must* be met, even when CLKR/X is generated by an internal clock source. The minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
- (4) This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

Table 6-51. Switching Characteristics Over Recommended Operating Conditions for McBSP⁽¹⁾⁽²⁾
(see [Figure 6-29](#))

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{d(CKSH-CKRXH)}$	Delay time, CLKS high to CLKR/X high for internal CLKR/X generated from CLKS input	3	10	ns
2	$t_c(CKRX)$	Cycle time, CLKR/X	CLKR/X int $2P^{(3)(4)(5)}$		ns
3	$t_w(CKRX)$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X int $C - 2^{(6)}$ $C + 2^{(6)}$		ns
4	$t_{d(CKRH-FRV)}$	Delay time, CLKR high to internal FSR valid	CLKR int -4 5.5		ns
9	$t_{d(CKXH-FXV)}$	Delay time, CLKX high to internal FSX valid	CLKX int -4 5.5		ns
			CLKX ext 2.5 14.5		
12	$t_{dis(CKXH-DXHZ)}$	Disable time, DX high impedance following last data bit from CLKX high	CLKX int -5.5 7.5		ns
			CLKX ext -2.1 16		
13	$t_{d(CKXH-DXV)}$	Delay time, CLKX high to DX valid	CLKX int $-4 + D1^{(7)}$ $5.5 + D2^{(7)}$		ns
			CLKX ext $2.5 + D1^{(7)}$ $14.5 + D2^{(7)}$		
14	$t_{d(FXH-DXV)}$	Delay time, FSX high to DX valid ONLY applies when in data delay 0 (XDATDLY = 00b) mode	FSX int -4 ⁽⁸⁾ 5 ⁽⁸⁾		ns
			FSX ext 1 ⁽⁸⁾ 14.5 ⁽⁸⁾		

- (1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) Minimum delay times also represent minimum output hold times.
- (3) Minimum CLKR/X cycle times must be met, even when CLKR/X is generated by an internal clock source. Minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
- (4) P = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use P = 10 ns.
- (5) Use whichever value is greater.
- (6) C = H or L
S = sample rate generator input clock = P if CLKSM = 1 (P = SYSCLK3 period)
S = sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)
H = CLKX high pulse width = $(CLKGDV/2 + 1) * S$ if CLKGDV is even
H = $(CLKGDV + 1)/2 * S$ if CLKGDV is odd
L = CLKX low pulse width = $(CLKGDV/2) * S$ if CLKGDV is even
L = $(CLKGDV + 1)/2 * S$ if CLKGDV is odd
CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see (4) above).
- (7) Extra delay from CLKX high to DX valid **applies only to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P
- (8) Extra delay from FSX high to DX valid **applies only to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P

A. Parameter No. 13 applies to the first data bit only when XDATDLY ≠ 0.

Figure 6-34. McBSP Timing as SPI Master or Slave: CLKSTP = 11b, CLKXP = 1

6.15 Multichannel Audio Serial Port (McASP0) Peripheral

The McASP functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and intercomponent digital audio interface transmission (DIT).

6.15.1 McASP0 Device-Specific Information

The DM6435 device includes one multichannel audio serial port (McASP) interface peripheral (McASP0). The McASP0 is a serial port optimized for the needs of multichannel audio applications.

The McASP0 consists of a transmit and receive section. These sections can operate completely independently with different data formats, separate master clocks, bit clocks, and frame syncs or alternatively, the transmit and receive sections may be synchronized. The McASP module also includes a pool of 16 shift registers that may be configured to operate as either transmit data or receive data.

The transmit section of the McASP can transmit data in either a time-division-multiplexed (TDM) synchronous serial format or in a digital audio interface (DIT) format where the bit stream is encoded for S/PDIF, AES-3, IEC-60958, CP-430 transmission. The receive section of the McASP supports the TDM synchronous serial format.

The McASP can support one transmit data format (either a TDM format or DIT format) and one receive format at a time. All transmit shift registers use the same format and all receive shift registers use the same format. However, the transmit and receive formats need not be the same.

Both the transmit and receive sections of the McASP also support burst mode which is useful for non-audio data (for example, passing control information between two DSPs).

The McASP peripheral has additional capability for flexible clock generation, and error detection/handling, as well as error management.

For more detailed information on and the functionality of the McASP0 peripheral, see the *TMS320DM643x DMP Multichannel Audio Serial Port (McASP) User's Guide* (literature number SPRU980).

6.15.1.1 McASP Block Diagram

Figure 6-35 illustrates the major blocks along with external signals of the TMS320DM6435 McASP0 peripheral; and shows the 4 serial data [AXR] pins.

			ACLKR/X ext	-4.5 12.5	ns

(1) A = (ACLKR/X period)/2 in ns. For example, when ACLKR/X period is 25 ns, use A = 12.5 ns.

(2) AH = (AHCLKR/X period)/2 in ns. For example, when AHCLKR/X period is 25 ns, use AH = 12.5 ns.

(3) ACLKX internal: ACLKXCTL.CLKXM=1, PDIR.ACLKX = 1
 ACLKX external input: ACLKXCTL.CLKXM=0, PDIR.ACLKX=0
 ACLKX external output: ACLKXCTL.CLKXM=0, PDIR.ACLKX=1
 ACLKR internal: ACLKRCTL.CLKRM=1, PDIR.ACLKR = 1
 ACLKR external input: ACLKRCTL.CLKRM=0, PDIR.ACLKR=0
 ACLKR external output: ACLKRCTL.CLKRM=0, PDIR.ACLKR=1

- A. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).
- B. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

Figure 6-36. McASP Input Timings

- A. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).
- B. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

Figure 6-37. McASP Output Timings

6.16 High-End Controller Area Network Controller (HECC)

The DM6435 device has a High-End Controller Area Network Controllers (HECC). The HECC uses established protocol to communicate serially with other controllers in harsh environments. The HECC is fully compliant with the Controller Area Network (CAN) protocol, version 2.0B.

Key features of the HECC include the following:

- CAN, version 2.0B compliant
- 32 RX/TX message objects
- 32 receive identifier masks
- Programmable wake-up on bus activity
- Programmable interrupt scheme
- Automatic reply to a remote request
- Automatic re-transmission in case of error or loss of arbitration
- Protection against reception of a new message
- 32-bit time stamp
- Local network time counter
- Programmable priority register for each message
- Programmable transmission and reception time-out
- HECC/SCC mode of operation
- Standard-Extended Identifier
- Self-test mode

For more details on the HECC, see the *TMS320DM643x High-End CAN Controller (HECC) User's Guide* (literature number SPRU981).

6.16.1 HECC Device-Specific Information

Software **must not** access "Reserved" locations of the HECC. Access to HECC "Reserved" locations may hang the device.

6.16.2 HECC Peripheral Register Description(s)

Table 6-65 through Table 6-68 show the High-End CAN Controller (HECC) registers. For more detailed information, see the *TMS320DM643x DMP High-End CAN Controller User's Guide* (literature number [SPRU981](#)).

Table 6-65. HECC Control and Status Registers

Table 6-67. HECC Message Mailbox RAM⁽¹⁾⁽²⁾

HEX ADDRESS RANGE	DESCRIPTION
01C2 4000 – 01C2 400F	Mailbox 0 (4 32-bit Registers)
01C2 4010 – 01C2 401F	Mailbox 1 (4 32-bit Registers)
01C2 4020 – 01C2 402F	Mailbox 2 (4 32-bit Registers)
01C2 4030 – 01C2 403F	Mailbox 3 (4 32-bit Registers)
01C2 4040 – 01C2 404F	Mailbox 4 (4 32-bit Registers)
...	...
01C2 41E0 – 01C2 41EF	Mailbox 30 (4 32-bit Registers)
01C2 41F0 – 01C2 41FF	Mailbox 31 (4 32-bit Registers)

- (1) This table summarizes the address ranges for the Message Mailboxes 0 to 31. For the contents within each Message Mailbox RAM, see [Table 6-68, Message Mailbox n RAM Entries](#).
- (2) For SCC mode, *only* Mailboxes 0 to 15 are supported.

Table 6-68. HECC Message Mailbox n RAM Entries⁽¹⁾

HEX ADDRESS OFFSET (within RAM)	ACRONYM ⁽²⁾	MAILBOX REGISTER NAME
0	MIDn	Message Identifier Register for Mailbox n
4	MCFn	Message Control Field Register for Mailbox n
8	MDLn	Message Data Low-Word Register for Mailbox n
C	MDHn	Message Data High-Word Register for Mailbox n

- (1) For the hex address range of Mailbox n, see [Table 6-67, Message Mailbox RAM](#). For example, Message Mailbox 0 occupies hex address range 0x01C2 4000 – 0x01C2 400F.
- (2) The suffix "n" indicates the Message Mailbox number. For example, Message Mailbox 0 has the following Message Mailbox Registers: MID0, MCF0, MDL0, and MDH0.

6.16.3 HECC Electrical Data/Timing

Table 6-69. Timing Requirements for HECC Receive⁽¹⁾ (see Figure 6-38)

NO.			-7I-6I-5I-4 -LI-Q6I-Q5I-Q4		UNIT
			MIN	MAX	
1	$f_{(\text{baud})}$	Maximum programmable baud rate			1 Mbps
2	$t_w(\text{HECC_RX})$	Pulse duration, receive data bit	H - 2	H + 2	ns

(1) H = HECC baud time = 1/programmed baud rate.

Table 6-70. Switching Characteristics Over Recommended Operating Conditions for HECC Transmit⁽¹⁾ (see Figure 6-38)

NO.	PARAMETER	-7I-6I-5I-4 -LI-Q6I-Q5I-Q4		UNIT	
		MIN	MAX		
3	$f_{(\text{baud})}$	Maximum programmable baud rate			1 Mbps
4	$t_w(\text{HECC_TX})$	Pulse duration, transmit data bit	H - 2	H + 2	ns

(1) H = HECC baud time = 1/programmed baud rate.

Figure 6-38. HECC Transmit/Receive Timing

6.17 Ethernet Media Access Controller (EMAC)

The Ethernet Media Access Controller (EMAC) provides an efficient interface between DM6435 and the network. The DM6435 EMAC supports both 10Base-T (10 Mbits/second [Mbps]) and 100Base-TX (100 Mbps) in either half- or full-duplex mode. The EMAC module also supports hardware flow control and quality of service (QoS) support.

The EMAC controls the flow of packet data from the DM6435 device to the PHY. The MDIO module controls PHY configuration and status monitoring.

The EMAC module conforms to the IEEE 802.3-2002 standard, describing the “Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer” specifications. The IEEE 802.3 standard has also been adopted by ISO/IEC and re-designated as ISO/IEC 8802-3:2000(E).

Deviation from this standard, the EMAC module does not use the Transmit Coding Error signal MTXER. Instead of driving the error pin when an underflow condition occurs on a transmitted frame, the EMAC will intentionally generate an incorrect checksum by inverting the frame CRC, so that the transmitted frame will be detected as an error by the network.

Both the EMAC and the MDIO modules interface to the DM6435 device through a custom interface that allows efficient data transmission and reception. This custom interface is referred to as the EMAC control module, and is considered integral to the EMAC/MDIO peripheral. The control module is also used to multiplex and control interrupts.

For the *DM6435 Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module User's Guide* (literature number SPRU941) which describes the DM6435 EMAC peripheral in detail, see [Section 2.9, Documentation Support](#) section . For a list of supported registers and register fields, see [Table 6-71 \[Ethernet MAC \(EMAC\) Control Registers\]](#) and [Table 6-72 \[EMAC Statistics Registers\]](#) in this data manual.

6.17.1 EMAC Peripheral Register Description(s)

Table 6-71. Ethernet MAC (EMAC) Control Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME

6.18 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The Management Data Input/Output (MDIO) module implements the 802.3 serial management interface to interrogate and control Ethernet PHY(s) using a shared two-wire bus. Host software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC, retrieve the negotiation results, and configure required parameters in the EMAC module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor. Only one PHY may be connected at any given time.

For more detailed information on the MDIO peripheral, see the *Documentation Support* section for the Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module Reference Guide. For a list of supported registers and register fields, see [Table 6-79](#) [MDIO Registers] in this data manual.

6.18.1 Peripheral Register Description(s)

6.19 Timers

The DM6435 device has 3 64-bit general-purpose timers which have the following features:

- 64-bit count-up counter
- Timer modes:
 - 64-bit general-purpose timer mode (Timer 0 and 1)
 - Dual 32-bit general-purpose timer mode (Timer 0 and 1)
 - Watchdog timer mode (Timer 2)
- 2 possible clock sources:

- Internal clock
- External clock input via timer input pin TINPL (Timer 0 and 1 only)
- 2 operation modes:
 - One-time operation (timer runs for one period then stops)
 - Continuous operation (timer automatically resets after each period)
- Generates interrupts to the DSP
- Generates sync event to EDMA
- Causes device global reset upon watchdog timer timeout (Timer 2 only)

For more detailed information, see [Section 2.9, Documentation Support](#) for the *TMS320DM643x DMP 64-Bit Timer User's Guide* (literature number SPRU989).

6.19.2 Timer Electrical Data/Timing

Table 6-85. Timing Requirements for Timer Input⁽¹⁾⁽²⁾⁽³⁾ (see Figure 6-45)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{w(TINPH)}$	Pulse duration, TINPxL high	TINP0L, if TIMERCTL.TINPOSEL = 0 [default]	2P	ns
			TINP0L, if TIMERCTL.TINPOSEL = 1	0.33P	ns
			TINP1L	2P	ns
2	$t_{w(TINPL)}$	Pulse duration, TINPxL low	TINP0L, if TIMERCTL.TINPOSEL = 0 [default]	2P	ns
			TINP0L, if TIMERCTL.TINPOSEL = 1	0.33P	ns
			TINP1L	2P	ns

- (1) P = MXI/CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use $P = 37.037$ ns.
- (2) The TIMERCTL.TINPOSEL field in the System Module determines if the TINP0L input directly goes to Timer 0 (TIMERCTL.TINPOSEL=0), or if the TINP0L input is first divided down by 6 before going to Timer 0 (TIMERCTL.TINPOSEL=1).
- (3) TINP1L input goes directly to Timer 1.

Table 6-86. Switching Characteristics Over Recommended Operating Conditions for Timer Output⁽¹⁾ (see Figure 6-45)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
3	$t_{w(TOUTH)}$	Pulse duration, TOUTxL high	P		ns
4	$t_{w(TOURL)}$	Pulse duration, TOUTxL low	P		ns

- (1) P = MXI/CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 27 MHz, use $P = 37.037$ ns.

Figure 6-45. Timer Timing

6.20 Pulse Width Modulator (PWM)

The 3 DM6435 Pulse Width Modulator (PWM) peripherals support the following features:

- Period counter
- First-phase duration counter
- Repeat count for one-shot operation
- Configurable to operate in either one-shot or continuous mode
- Buffered period and first-phase duration registers
- One-shot operation triggerable by hardware events with programmable edge transitions. (low-to-high or high-to-low).
- One-shot operation generates N+1 periods of waveform, N being the repeat count register value
- Emulation support

The register memory maps for PWM0/1/2 are shown in [Table 6-87](#), [Table 6-88](#), and [Table 6-89](#).

6.21 VLYNQ

The DM6435 VLYNQ peripheral provides a high speed serial communications interface with the following features.

- Low Pin Count
- Scalable Performance / Support
- Simple Packet Based Transfer Protocol for Memory Mapped Access
 - Write Request / Data Packet
 - Read Request Packet
 - Read Response Data Packet
 - Interrupt Request Packet
- Supports both Symmetric and Asymmetric Operation
 - Tx pins on first device connect to Rx pins on second device and vice versa
 - Data pin widths are automatically detected after reset
 - Request packets, response packets, and flow control information are all multiplexed and sent across the same physical pins
 - Supports both Host/Peripheral and Peer to Peer communication
- Simple Block Code Packet Formatting (8b/10b)
- In Band Flow Control
 - No extra pins needed
 - Allows receiver to momentarily throttle back transmitter when overflow is about to occur
 - Uses built in special code capability of block code to seamlessly interleave flow control information with user data
 - Allows system designer to balance cost of data buffering versus performance
- Multiple outstanding transactions
- Automatic packet formatting optimizations
- Internal loop-back mode

6.21.2 VLYNQ Electrical Data/Timing

Table 6-92. Timing Requirements for VLYNQ_CLK Input (see Figure 6-48)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_c(VCLK)$	Cycle time, VLYNQ_CLK	10		ns
2	$t_w(VCLKH)$	Pulse duration, VLYNQ_CLK high	3		ns
3	$t_w(VCLKL)$	Pulse duration, VLYNQ_CLK low	3		ns

Table 6-93. Switching Characteristics Over Recommended Operating Conditions for VLYNQ_CLK Output (see Figure 6-48)

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
1	$t_c(VCLK)$	Cycle time, VLYNQ_CLK	10	ns
2	$t_w(VCLKH)$	Pulse duration, VLYNQ_CLK high	4	ns
3	$t_w(VCLKL)$	Pulse duration, VLYNQ_CLK low	4	ns

Figure 6-48. VLYNQ_CLK Timing for VLYNQ

Table 6-94. Switching Characteristics Over Recommended Operating Conditions for Transmit Data for the VLYNQ Module (see Figure 6-49)

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
1	$t_d(VCLKH-TXDl)$	Delay time, VLYNQ_CLK high to VLYNQ_TXD[3:0] invalid	2.25	ns
2	$t_d(VCLKH-TXDv)$	Delay time, VLYNQ_CLK high to VLYNQ_TXD[3:0] valid	12	ns

Table 6-95. Timing Requirements for Receive Data for the VLYNQ Module⁽¹⁾ (see Figure 6-49)

NO.				-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
				MIN	MAX	
3	$t_{su(RXDV-VCLKH)}$	Setup time, VLYNQ_RXD[3:0] valid before VLYNQ_CLK high	RTM disabled, RTM sample = 3	1.75		ns
			RTM enabled	(1)		ns
4	$t_{h(VCLKH-RXDV)}$	Hold time, VLYNQ_RXD[3:0] valid after VLYNQ_CLK high	RTM disabled, RTM sample = 3	3		ns
			RTM enabled	(1)		ns

(1) The VLYNQ receive timing manager (RTM) is a serial receive logic designed to eliminate setup and hold violations that could occur in traditional input signals. RTM logic automatically selects the setup and hold timing from one of eight data flops (see Table 6-96). When RTM logic is disabled, the setup and hold timing from the default data flop (3) is used.

Table 6-96. RTM RX Data Flop Hold/Setup Timing Constraints (Typical Values)

RX Data Flop	HOLD (Y)	SETUP (X)
0	1.3	0.9
1	1.4	0.7
2	1.5	-0.4
3	1.6	-0.6
4	1.8	-0.8
5	2.0	-1.0
6	2.2	-1.1
7	2.4	-1.2

Figure 6-49. VLYNQ Transmit/Receive Timing

6.22 General-Purpose Input/Output (GPIO)

The GPIO peripheral provides general-purpose pins that can be configured as either inputs or outputs. When configured as an output, a write to an internal register can control the state driven on the output pin. When configured as an input, the state of the input is detectable by reading the state of an internal register. In addition, the GPIO peripheral can produce CPU interrupts and EDMA events in different interrupt/event generation modes. The GPIO peripheral provides generic connections to external devices. The GPIO pins are grouped into banks of 16 pins per bank (i.e., bank 0 consists of GP[0:15]).

The DM6435 GPIO peripheral supports the following:

- Up to 111 3.3-V GPIO pins, GP[0:110]
- Interrupts:
 - Up to 8 unique GP[0:7] interrupts from Bank 0
 - 7 GPIO bank (aggregated) interrupt signals from each of the 7 banks of GPIOs
 - Interrupts can be triggered by rising and/or falling edge, specified for each interrupt capable GPIO signal
- DMA events:
 - Up to 8 unique GPIO DMA events from Bank 0
 - 7 GPIO bank (aggregated) DMA event signals from each of the 7 banks of GPIOs
- Set/clear functionality: Firmware writes 1 to corresponding bit position(s) to set or to clear GPIO signal(s). This allows multiple firmware processes to toggle GPIO output signals without critical section protection (disable interrupts, program GPIO, re-enable interrupts, to prevent context switching to another process during GPIO programming).
- Separate Input/Output registers
- Output register in addition to set/clear so that, if preferred by firmware, some GPIO output signals can be toggled by direct write to the output register(s).
- Output register, when read, reflects output drive status. This, in addition to the input register reflecting pin status and open-drain I/O cell, allows wired logic be implemented.

The memory map for the GPIO registers is shown in [Table 6-97](#). For more detailed information on GPIOs, see the *TMS320DM643x DMP General-Purpose Input/Output (GPIO) User's Guide* (literature number [SPRU988](#)).

6.22.1 GPIO Peripheral Register Description(s)

Table 6-97. GPIO Registers

0x01C6 70B0 - 0x01C6 7FFF	-	Reserved

6.22.2 GPIO Peripheral Input/Output Electrical Data/Timing

Table 6-98. Timing Requirements for GPIO Inputs⁽¹⁾ (see Figure 6-50)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{w(GPIH)}$	Pulse duration, GP[x] input high	2C ⁽²⁾		ns
2	$t_{w(GPIL)}$	Pulse duration, GP[x] input low	2C ⁽²⁾		ns

- (1) The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have DM6435 recognize the GP[x] input changes through software polling of the GPIO register, the GP[x] input duration must be extended to allow DM6435 enough time to access the GPIO register through the internal bus.
- (2) C = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use C = 10ns.

Table 6-99. Switching Characteristics Over Recommended Operating Conditions for GPIO Outputs (see Figure 6-50)

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
3	$t_{w(GPOH)}$	2C ⁽¹⁾⁽²⁾		ns
4	$t_{w(GPOL)}$	2C ⁽¹⁾⁽²⁾		ns

- (1) This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.
- (2) C = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use C = 10ns.

Figure 6-50. GPIO Port Timing

6.23 IEEE 1149.1 JTAG

The JTAG⁽³⁾ interface is used for BSDL testing and emulation of the DM6435 device.

$\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. **Note:** $\overline{\text{TRST}}$ is synchronous and **must** be clocked by TCK; otherwise, the boundary scan logic may not respond as expected after $\overline{\text{TRST}}$ is asserted.

For maximum reliability, DM6435 includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the device's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$.

When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the device after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

6.23.1 JTAG ID (JTAGID) Register Description(s)

(3) IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.

Table 6-100. JTAG ID (JTAGID) Register

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
0x01C4 0028	JTAGID	JTAG Identification Register	Read-only. Provides 32-bit JTAG ID of the device.

The JTAG ID register is a read-only register that identifies to the customer the JTAG/Device ID. For the DM6435 device, the JTAG ID register resides at address location 0x01C4 0028. For the actual register bit names and their associated bit field descriptions, see [Figure 6-51](#) and [Table 6-101](#).

31-28	27-12	11-1	0
VARIANT (4-Bit)	PART NUMBER (16-Bit)	MANUFACTURER (11-Bit)	LSB
R-n	R-1011 0111 0010 0001	R-0000 0010 111	R-1

LEGEND: R = Read, W = Write, n = value at reset

Figure 6-51. JTAG ID (JTAGID) Register—0x01C4 0028

Table 6-101. JTAG ID (JTAGID) Register Selection Bit Descriptions

BIT	NAME	DESCRIPTION
31:28	VARIANT	Variant (4-Bit) value. A read from this field always returns 0b0000.
27:12	PART NUMBER	Part Number (16-Bit) value. DM6435 value: 1011 0111 0010 0001.
11-1	MANUFACTURER	Manufacturer (11-Bit) value. DM6435 value: 0000 0010 111.
0	LSB	LSB. This bit is read as a "1" for DM6435.

6.23.2 JTAG Electrical Data/Timing

Table 6-102. Timing Requirements for JTAG Test Port (see Figure 6-52)

NO.		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
1	$t_c(\text{TCK})$ Cycle time, TCK	33		ns
3	$t_{su}(\text{TDIV-TCKH})$ Setup time, TDI/TMS/TRST valid before TCK high	2.5		ns
4	$t_h(\text{TCKH-TDIV})$ Hold time, TDI/TMS/TRST valid after TCK high	16.5		ns

Table 6-103. Switching Characteristics Over Recommended Operating Conditions for JTAG Test Port (see Figure 6-52)

7 Mechanical Data

The following table(s) show the thermal resistance characteristics for the PBGA–ZWT and ZDU mechanical package(s). For more details, see the *Thermal Considerations for TMS320DM64xx, TMS320DM64x, and TMS320C6000 Devices* Application Report (literature number [SPRAAL9](#)).

7.1 Thermal Data for ZWT

Table 7-1. Thermal Resistance Characteristics (PBGA Package) [ZWT]

NO.			°C/W ⁽¹⁾	AIR FLOW (m/s) ⁽²⁾
1	R θ_{JC}	Junction-to-case	5.4	N/A
2	R θ_{JB}	Junction-to-board	16.0	N/A
3			26.6	0.00
4	R θ_{JA}	Junction-to-free air	21.9	1.0
5			20.4	2.00
7			0.0	0.00
8	Psi $_{JT}$	Junction-to-package top	0.1	1.0
9			0.2	2.00
11			15.9	0.00
12	Psi $_{JB}$	Junction-to-board	15.8	1.0
13			15.3	2.00

(1) The junction-to-case measurement was conducted in a JEDEC defined 1S0P system. Other measurements were conducted in a JEDEC defined 1S2P system and will change based on environment as well as application.

For more information, see these three EIA/JEDEC standards:

- EIA/JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- EIA/JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*

(2) m/s = meters per second

7.1.1 Thermal Data for ZDU

Table 7-2. Thermal Resistance Characteristics (PBGA Package) [ZDU]

NO.			°C/W ⁽¹⁾	AIR FLOW (m/s) ⁽²⁾
1	R θ _{JC}	Junction-to-case	7.7	N/A
2	R θ _{JB}	Junction-to-board	10.5	N/A
3	R θ _{JA}	Junction-to-free air	19.7	0.00
4			15.5	1.0
5			14.3	2.00
7	Psi _{JT}	Junction-to-package top	4.9	0.00
8			5.1	1.0
9			5.2	2.00
11	Psi _{JB}	Junction-to-board	10.4	0.00
12			9.8	1.0
13			9.6	2.00

(1) The junction-to-case measurement was conducted in a JEDEC defined 1S0P system. Other measurements were conducted in a JEDEC defined 1S2P system and will change based on environment as well as application.

For more information, see these three EIA/JEDEC standards:

- EIA/JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- EIA/JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*

(2) m/s = meters per second

7.1.2 Packaging Information

The following packaging information and addendum reflect the most current data available for the designated device(s). This data is subject to change without notice and without revision of this document.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

ZWT (S-PBGA-N361)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. This is a Pb-free solder ball design.
 - D. Falls within JEDEC MO-275.

ZDU (S-PBGA-N376)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Falls within JEDEC MO-151
 - D. Thermally enhanced molded plastic package with heat slug (HSL).
 - E. This is a lead-free solder ball design.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
