

## 2.6-W STEREO AUDIO POWER AMPLIFIER WITH FOUR SELECTABLE GAIN SETTINGS AND MUX CONTROL

### FEATURES

- Compatible With PC 99 Desktop Line-Out Into 10-k $\Omega$  Load
- Internal Gain Control, Which Eliminates External Gain-Setting Resistors
- 2.6-W/Ch Output Power Into 3- $\Omega$  Load
- Input MUX Select Terminal
- PC-Beep Input
- Depop Circuitry
- Stereo Input MUX
- Fully Differential Input
- Low Supply Current and Shutdown Current
- Surface-Mount Power Packaging 24-Pin TSSOP PowerPAD™

### DESCRIPTION

The TPA0312 is a stereo audio power amplifier in a 24-pin TSSOP thermally enhanced package capable of delivering 2.6 W of continuous RMS power per channel into 3- $\Omega$  loads. This device minimizes the number of external components needed, simplifying the design, and freeing up board space for other features. When driving 1 W into 8- $\Omega$  speakers, the TPA0312 has less than 0.65% THD+N across its specified frequency range. Included within this device is integrated depop circuitry that virtually eliminates transients that cause noise in the speakers.

Amplifier gain is internally configured and controlled by way of two terminals (GAIN0 and GAIN1). BTL gain settings of 6 dB, 10 dB, 15.6 dB, and 21.6 dB (inverting) are provided, whereas SE gain is always configured as 4.1 dB for headphone drive. An internal input MUX allows two sets of stereo inputs to the amplifier. The HP/LINE terminal allows the user to select which MUX input is active, regardless of whether the amplifier is in SE or BTL mode. In notebook applications, where internal speakers are driven as BTL and the line outputs (often headphone drive) are required to be SE, the TPA0312 automatically switches into SE mode when the SE/BTL input is activated, and this reduces the gain to 4.1 dB.

The TPA0312 consumes only 6 mA of supply current during normal operation. A miserly shutdown mode reduces the supply current to 150  $\mu$ A.

The PowerPAD™ package (PWP) delivers a level of thermal performance that was previously achievable only in TO-220-type packages. Thermal impedances of approximately 35°C/W are readily realized in multilayer PCB applications. This allows the TPA0312 to operate at full power into 8- $\Omega$  loads at an ambient temperature of 85°C.

### AVAILABLE OPTIONS

T <sub>A</sub>	PACKAGED DEVICE
	TSSOP <sup>(1)</sup> (PWP)
-40°C to 85°C	TPA0312PWP

- (1) The PWP package is available taped and reeled. To order a taped and reeled part, add the suffix R to the part number (e.g., TPA0312PWPR).

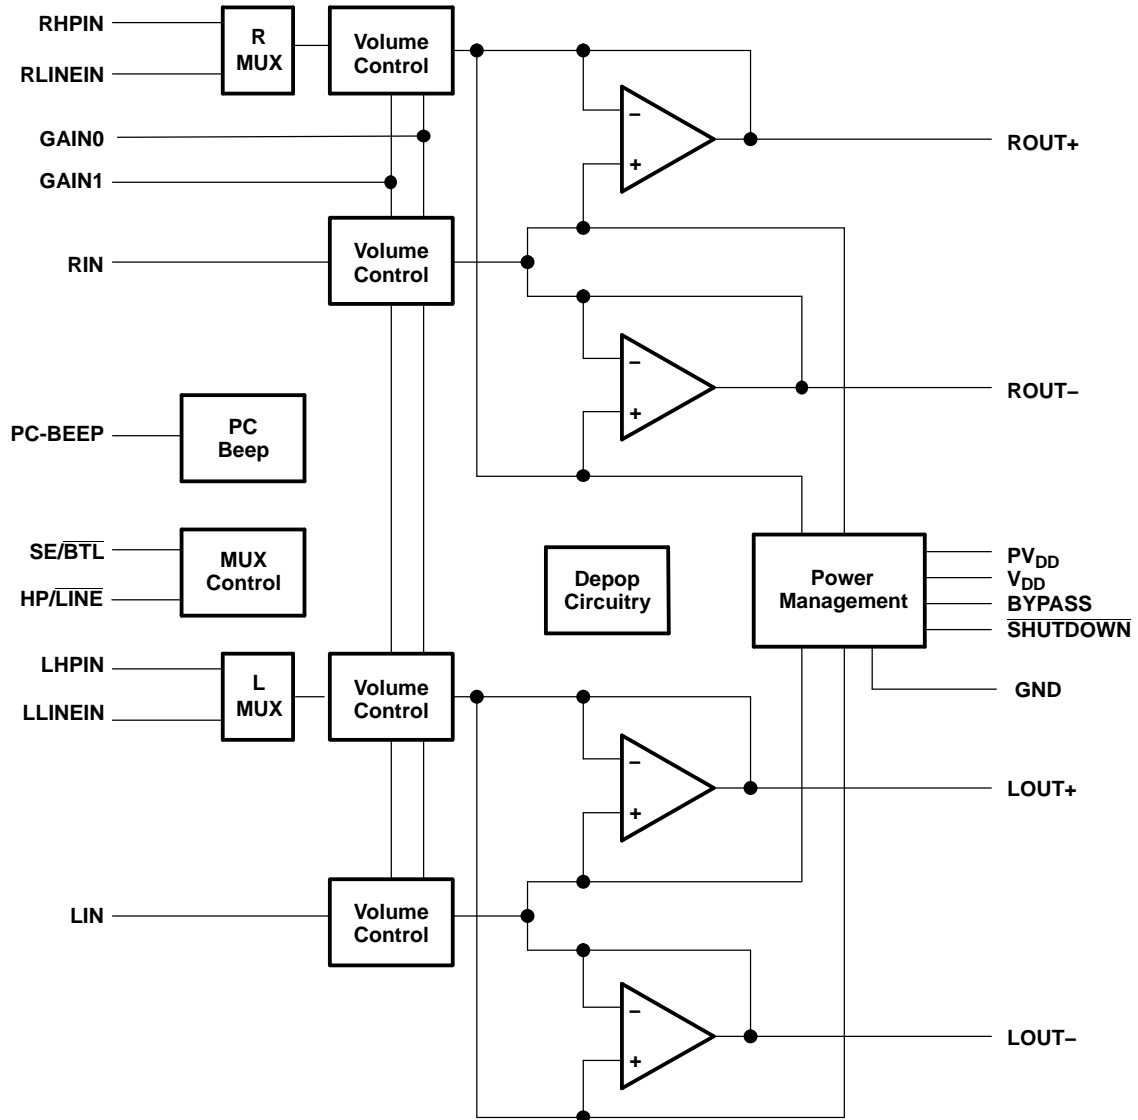

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**FUNCTIONAL BLOCK DIAGRAM**

**TERMINAL FUNCTIONS**

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
BYPASS	11		Tap to voltage divider for internal mid-supply bias generator
GAIN0	2	I	Bit 0 of gain control
GAIN1	3	I	Bit 1 of gain control
GND	1, 12, 13, 24		Ground connection for circuitry. Connected to the thermal pad.
LHPIN	6	I	Left-channel headphone input, selected when $SE/\overline{BTL}$ is held high
LIN	10	I	Common left input for fully differential input. AC ground for single-ended inputs.
LLINEIN	5	I	Left-channel line input, selected when $SE/\overline{BTL}$ is held low
LOUT+	4	O	Left-channel positive output in BTL mode and positive output in SE mode
LOUT-	9	O	Left-channel negative output in BTL mode and high-impedance in SE mode
PC-BEEP	14	I	The input for PC Beep mode. PC-BEEP is enabled when a > 1.5-V (peak-to-peak) square wave is input to PC-BEEP
HP/ $\overline{LINE}$	17	I	HP/ $\overline{LINE}$ is the input MUX control input. When the HP/ $\overline{LINE}$ terminal is held high, the headphone inputs (LHPIN or RHPIN [6, 20]) are active. When the HP/ $\overline{LINE}$ terminal is held low, the line inputs (LLINEIN or RLINEIN [5, 23]) are active.
PV <sub>DD</sub>	7, 18	I	Power supply for output stage
RHPIN	20	I	Right-channel headphone input, selected when $SE/\overline{BTL}$ is held high
RIN	8	I	Common right input for fully differential input. AC ground for single-ended inputs.
RLINEIN	23	I	Right-channel line input, selected when $SE/\overline{BTL}$ is held low
ROUT+	21	O	Right-channel positive output in BTL mode and positive output in SE mode
ROUT-	16	O	Right-channel negative output in BTL mode and high-impedance in SE mode
$\overline{SHUTDOWN}$	22	I	Places entire IC in shutdown mode when held low, except PC-BEEP remains active
$SE/\overline{BTL}$	15	I	Hold $SE/\overline{BTL}$ low for BTL mode and hold high for SE mode.
V <sub>DD</sub>	19	I	Analog V <sub>DD</sub> input supply. This terminal needs to be isolated from PV <sub>DD</sub> to achieve highest performance.
Thermal Pad			Connect to ground. Must be soldered down in all applications to properly secure the device on the PC board.

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

$V_{DD}$	Supply voltage	6 V
$V_I$	Input voltage	-0.3 V to $V_{DD} + 0.3$ V
	Continuous total power dissipation	Internally limited (see Dissipation Rating Table)
$T_A$	Operating free-air temperature range	-40°C to 85°C
$T_J$	Operating junction temperature range	-40°C to 150°C
$T_{stg}$	Storage temperature range	-65°C to 85°C
	Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## DISSIPATION RATING TABLE

PACKAGE	$T_A \leq 25^\circ\text{C}$	DERATING FACTOR	$T_A = 70^\circ\text{C}$	$T_A = 85^\circ\text{C}$
PWP	2.7 W <sup>(1)</sup>	21.8 mW/°C	1.7 W	1.4 W

- (1) See the Texas Instruments document, *PowerPAD Thermally Enhanced Package Application Report* (literature number SLMA002), for more information on the PowerPAD package. The thermal data was measured on a PCB layout based on the information in the section entitled *Texas Instruments Recommended Board for PowerPAD* of the before-mentioned document.

## RECOMMENDED OPERATING CONDITIONS

			MIN	MAX	UNIT
$V_{DD}$	Supply voltage		4.5	5.5	V
$V_{IH}$	High-level input voltage	SE/ $\overline{\text{BTL}}$ , HP/ $\overline{\text{LINE}}$ , GAIN0, GAIN1	$0.8 \times V_{DD}$		V
		SHUTDOWN	2		
$V_{IL}$	Low-level input voltage	SE/ $\overline{\text{BTL}}$ , HP/ $\overline{\text{LINE}}$	$0.6 \times V_{DD}$		V
		GAIN0, GAIN1	$0.4 \times V_{DD}$		
		SHUTDOWN	0.8		
$T_A$	Operating free-air temperature		-40	85	°C

## ELECTRICAL CHARACTERISTICS

at specified free-air temperature,  $V_{DD} = 5$  V,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$ V_{OO} $	Output offset voltage (measured differentially)	$V_I = 0$ , $A_v = 6$ dB			25	mV
PSRR	Power supply rejection ratio	$V_{DD} = 4.5$ V to 5.5 V		77		dB
$ I_{IH} $	High-level input current	$V_{DD} = 5.5$ V, $V_I = V_{DD}$			1	$\mu\text{A}$
$ I_{IL} $	Low-level input current	$V_{DD} = 5.5$ V, $V_I = 0$ V			1	$\mu\text{A}$
$I_{DD}$	Supply current	BTL mode		6	10	mA
		SE mode		3	5	
$I_{DD(SD)}$	Supply current, shutdown mode			150	300	$\mu\text{A}$

**OPERATING CHARACTERISTICS**
 $V_{DD} = 5\text{ V}$ ,  $T_A = 25^\circ\text{C}$ ,  $R_L = 8\ \Omega$ , Gain = 6 dB, BTL mode

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
$P_O$	Output power	$R_L = 3\ \Omega$	THD + N = 10%	2.6			W
			THD + N = 1%,	2.05			
THD + N	Total harmonic distortion plus noise	$P_O = 1\text{ W}$ ,	f = 20 Hz to 15 kHz		0.65%		
$B_{OM}$	Maximum output power bandwidth	THD = 5%		>15			kHz
	Supply ripple rejection ratio	f = 1 kHz, $C_B = 0.47\ \mu\text{F}$	BTL mode		72		dB
SNR	Signal-to-noise ratio			105			dB
$V_n$	Noise output voltage	$C_B = 0.47\ \mu\text{F}$ , f = 20 Hz to 20 kHz	BTL mode	20			$\mu\text{V}_{RMS}$
			SE mode	18			
$Z_I$	Input impedance			See Table 1

## THERMAL INFORMATION

The thermally enhanced PWP package is based on the 24-pin TSSOP, but includes a thermal pad (see Figure 36) to provide an effective thermal contact between the IC and the PWB.

Traditionally, surface mount and power have been mutually exclusive terms. A variety of scaled-down TO-220-type packages have leads formed as gull wings to make them applicable for surface-mount applications. These packages, however, have only two shortcomings: they do not address the low profile (< 2 mm) requirements of many of today's advanced systems, and they do not offer a terminal-count high enough to accommodate increasing integration. On the other hand, traditional low-power, surface-mount packages require power-dissipation derating that severely limits the usable range of many high-performance analog circuits.

The PowerPAD™ package (thermally enhanced TSSOP) combines fine-pitch, surface-mount technology with thermal performance comparable to much larger power packages.

The PowerPAD™ package is designed to optimize the heat transfer to the PWB. Because of the small size and limited mass of a TSSOP package, thermal enhancement is achieved by improving the thermal conduction paths that remove heat from the component. The thermal pad is formed using a patented lead-frame design and manufacturing technique to provide a direct connection to the heat-generating IC. When this pad is soldered or otherwise thermally coupled to an external heat dissipator, high power dissipation in the ultrathin, fine-pitch, surface-mount package can be reliably achieved.

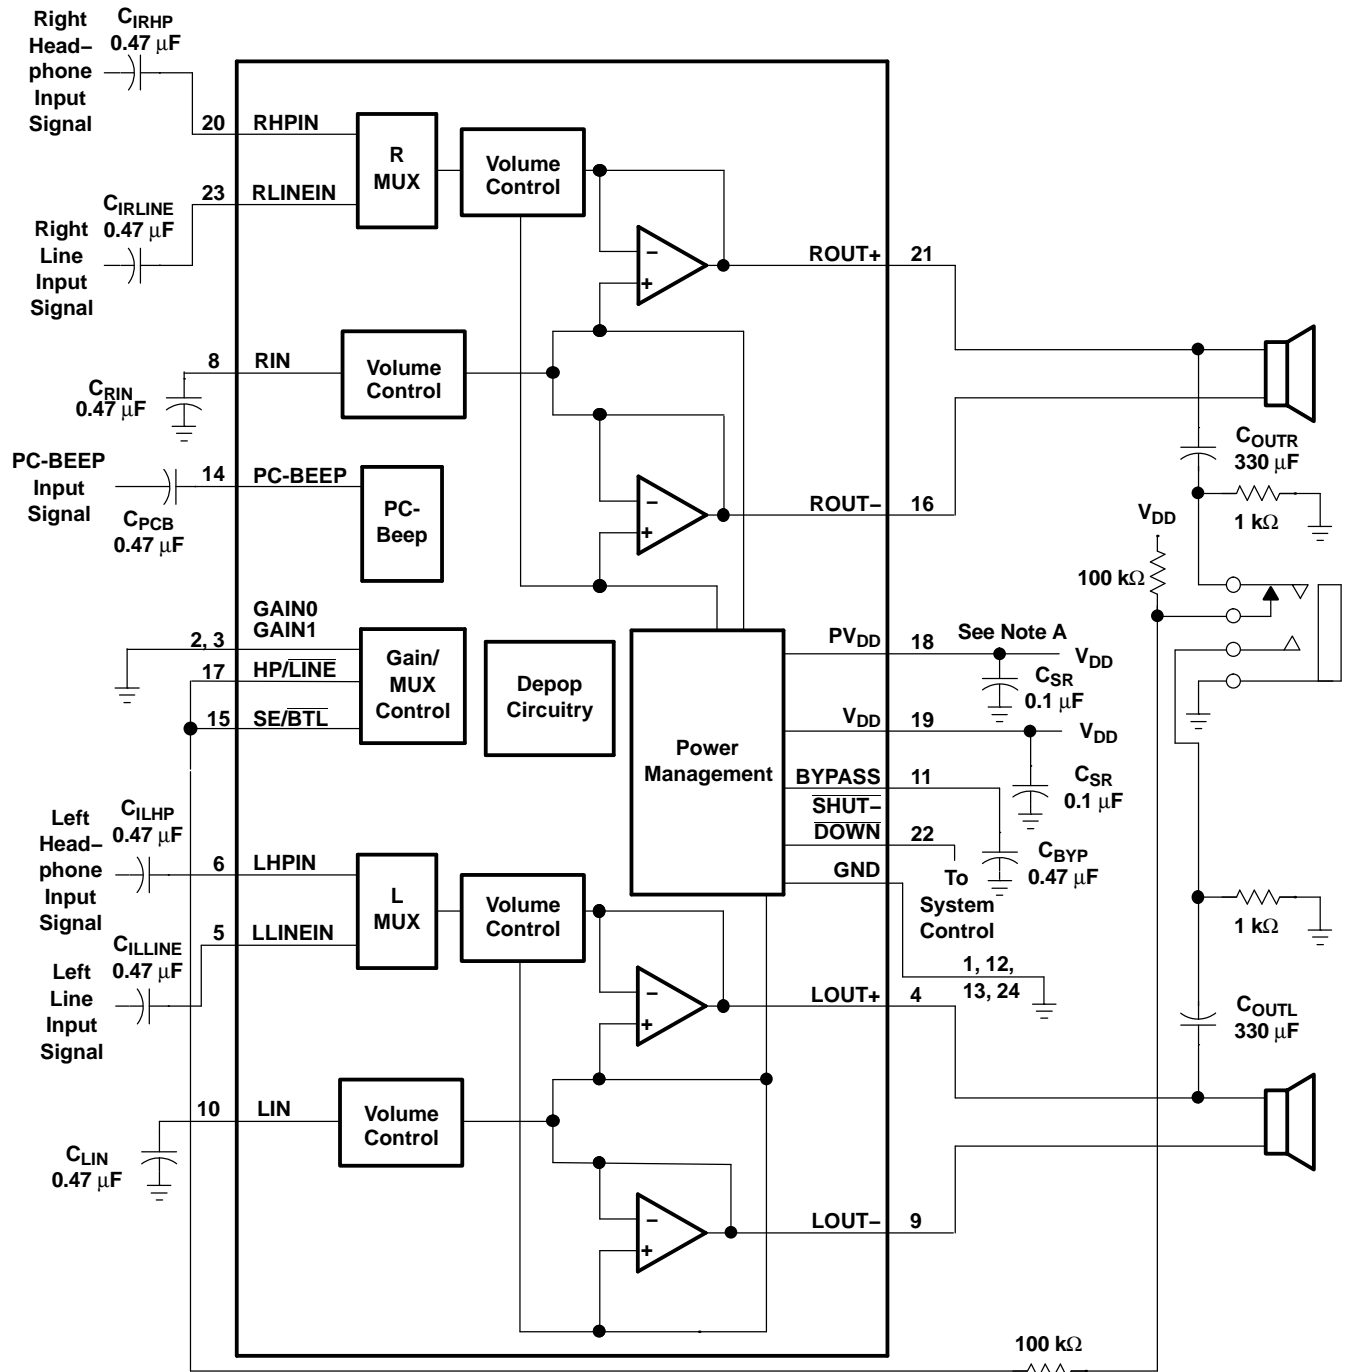

**Figure 36. Views of Thermally Enhanced PWP Package**

**APPLICATION INFORMATION**

**SELECTION OF COMPONENTS**

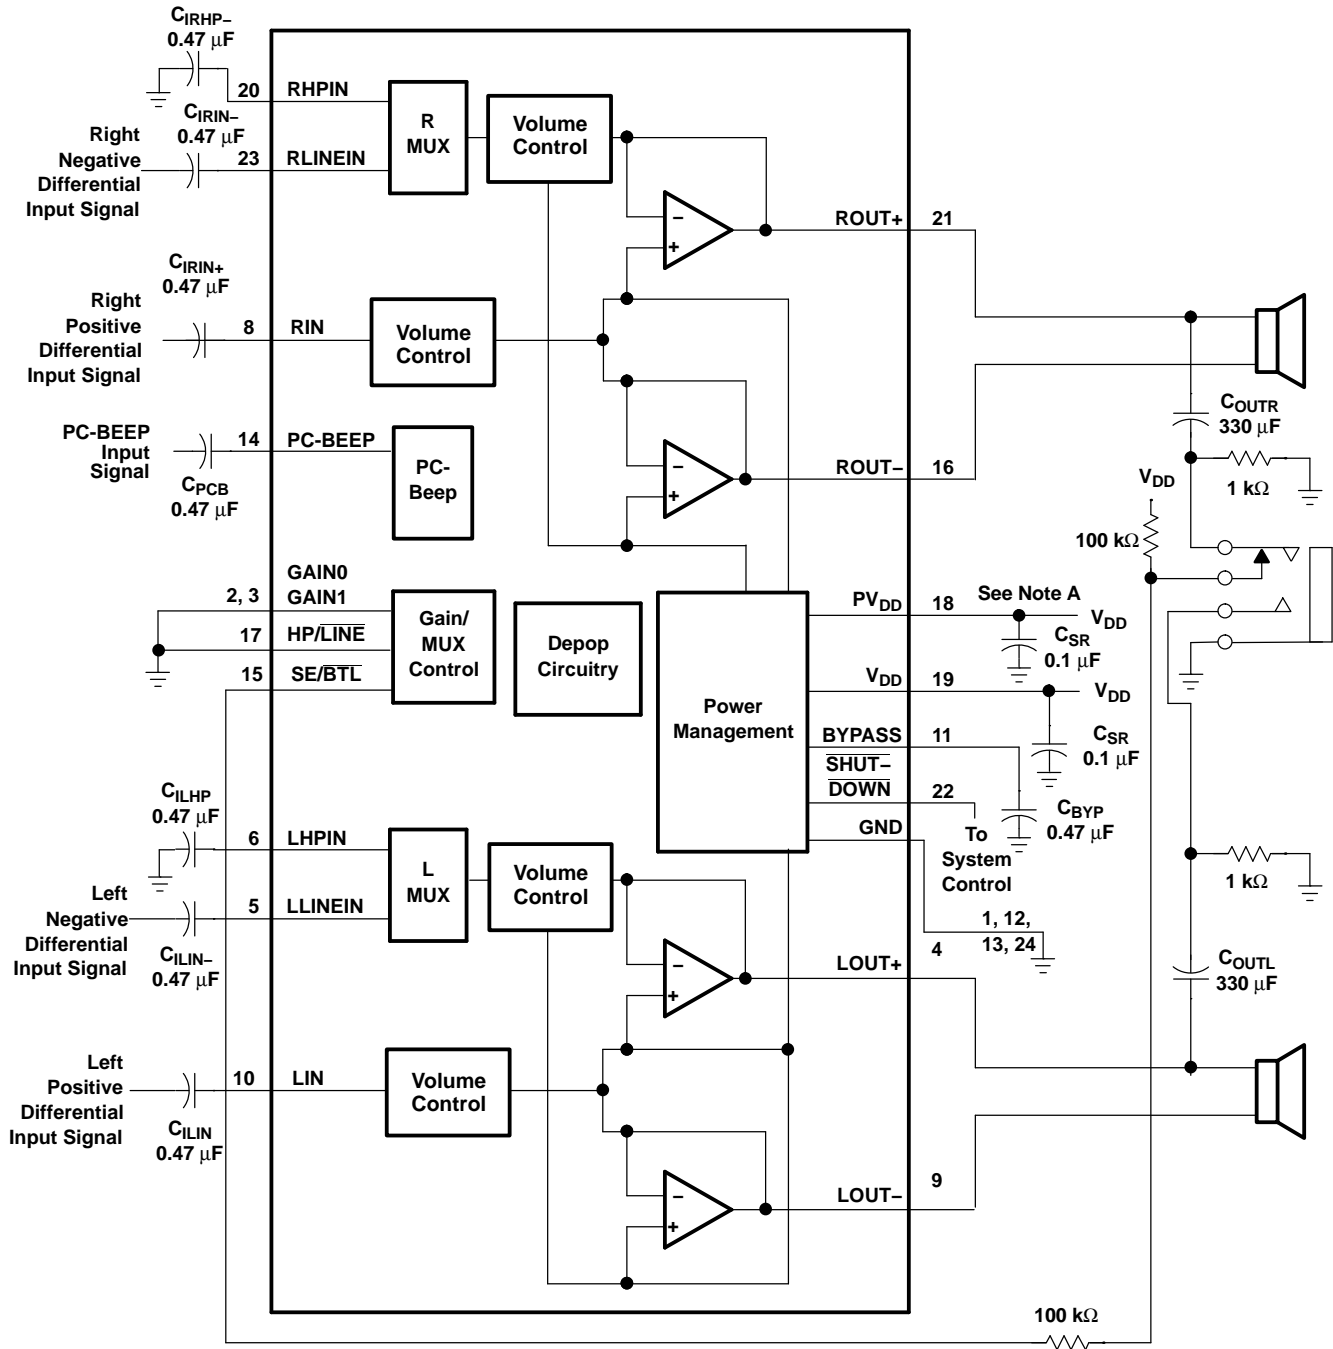

Figure 37 and Figure 38 are schematic diagrams of typical notebook computer application circuits.

- A. A 0.1-μF ceramic capacitor should be placed as close as possible to the IC. For filtering lower frequency noise signals, a larger electrolytic capacitor of 10 μF or greater should be placed near the audio power amplifier.

**Figure 37. Typical TPA0312 Application Circuit Using Single-Ended Inputs and Input MUX**

APPLICATION INFORMATION (continued)

- A. A 0.1-μF ceramic capacitor should be placed as close as possible to the IC. For filtering lower frequency noise signals, a larger electrolytic capacitor of 10 μF or greater should be placed near the audio power amplifier.

Figure 38. Typical TPA0312 Application Circuit Using Differential Inputs

## GAIN SETTING VIA GAIN0 AND GAIN1 INPUTS

The gain of the TPA0312 is set by two input terminals, GAIN0 and GAIN1.

**Table 1. GAIN SETTINGS**

GAIN0	GAIN1	SE/BTL	A <sub>v</sub>
0	0	0	6 dB
0	1	0	10 dB
1	0	0	15.6 dB
1	1	0	21.6 dB
X	X	1	4.1 dB

The gains listed in Table 1 are realized by changing the taps on the input resistors inside the amplifier. This causes the input impedance, Z<sub>i</sub>, to be dependant on the gain setting. The actual gain settings are controlled by ratios of resistors, so the actual gain distribution from part-to-part is quite good. However, the input impedance will shift by 30% due to shifts in the actual resistance of the input impedance.

For design purposes, the input network (discussed in the next section) should be designed assuming an input impedance of 10 kΩ, which is the absolute minimum input impedance of the TPA0312. At the lower gain settings, the input impedance could increase as high as 115 kΩ.

## INPUT RESISTANCE

Each gain setting is achieved by varying the input resistance of the amplifier, which can range from its smallest value to over 6 times that value. As a result, if a single capacitor is used in the input high pass filter, the –3-dB or cutoff frequency also changes by over 6 times. If an additional resistor is connected from the input pin of the amplifier to ground, as shown in the following figure, the variation of the cutoff frequency is much reduced.

The typical input impedance at each gain setting is given in the table below:

A <sub>v</sub>	Z <sub>i</sub>
21.6 dB	25 kΩ
15.6 dB	45 kΩ
10 dB	70 kΩ
6 dB	90 kΩ

The –3-dB frequency can be calculated using Equation 1:

$$f_{-3 \text{ dB}} = \frac{1}{2\pi C(R \parallel R_i)} \quad (1)$$

If the filter must be more accurate, the value of the capacitor should be increased while the value of the resistor to ground should be decreased. In addition, the order of the filter could be increased.

## INPUT CAPACITOR, C<sub>i</sub>

In the typical application, an input capacitor, C<sub>i</sub>, is required to allow the amplifier to bias the input signal to the proper dc level for optimum operation. In this case, C<sub>i</sub> and the input impedance of the amplifier, Z<sub>i</sub>, form a high-pass filter with the corner frequency determined in Equation 2.

$$f_{c(\text{highpass})} = \frac{1}{2\pi Z_1 C_1}$$

(2)

The value of  $C_1$  is important to consider as it directly affects the bass (low frequency) performance of the circuit. Consider the example where  $Z_1$  is 26 k $\Omega$  and the specification calls for a flat bass response down to 65 Hz. Equation 2 is reconfigured as Equation 3.

$$C_1 = \frac{1}{2\pi Z_1 f_c}$$

(3)

In this example,  $C_1$  is 94 nF; so, one would likely choose a value in the range of 0.1 nF to 1  $\mu$ F. A further consideration for this capacitor is the leakage path from the input source through the input network ( $C_1$ ) and the feedback network to the load. This leakage current creates a dc offset voltage at the input to the amplifier that reduces useful headroom, especially in high-gain applications. For this reason, a low-leakage tantalum or ceramic capacitor is the best choice. When polarized capacitors are used, the positive side of the capacitor should face the amplifier input in most applications as the dc level there is held at  $V_{DD}/2$ , which is likely higher than the source dc level. Note that it is important to confirm the capacitor polarity in the application.

### POWER SUPPLY DECOUPLING, $C_S$

The TPA0312 is a high-performance CMOS audio amplifier that requires adequate power supply decoupling to ensure that the output total harmonic distortion (THD) is as low as possible. Power supply decoupling also prevents oscillations for long lead lengths between the amplifier and the speaker. The optimum decoupling is achieved by using two capacitors of different types that target different types of noise on the power supply leads. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically 0.1  $\mu$ F, placed as close as possible to the device  $V_{DD}$  lead, works best. For filtering lower-frequency noise signals, a larger aluminum electrolytic capacitor of 10  $\mu$ F or greater placed near the audio power amplifier is recommended.

### MIDRAIL BYPASS CAPACITOR, $C_{BYP}$

The midrail bypass capacitor,  $C_{BYP}$ , is the most critical capacitor and serves several important functions. During start-up or recovery from shutdown mode,  $C_{BYP}$  determines the rate at which the amplifier starts up. The second function is to reduce noise produced by the power supply caused by coupling into the output drive signal. This noise is from the midrail generation circuit internal to the amplifier, which appears as degraded PSRR and THD+N.

Bypass capacitor values of 0.47- $\mu$ F to 1- $\mu$ F ceramic or tantalum low-ESR capacitors are recommended for the best THD and noise performance.

## OUTPUT COUPLING CAPACITOR, $C_C$

In the typical single-supply SE configuration, an output coupling capacitor ( $C_C$ ) is required to block the dc bias at the output of the amplifier thus preventing dc currents in the load. As with the input coupling capacitor, the output coupling capacitor and impedance of the load form a high-pass filter governed by Equation 4.

$$f_{c(\text{high})} = \frac{1}{2\pi R_L C_C}$$

(4)

The main disadvantage, from a performance standpoint, is the load impedances are typically small, which drives the low-frequency corner higher, degrading the bass response. Large values of  $C_C$  are required to pass low frequencies into the load. Consider the example where a  $C_C$  of 330  $\mu\text{F}$  is chosen and loads vary from 3  $\Omega$ , 4  $\Omega$ , 8  $\Omega$ , 32  $\Omega$ , 10 k $\Omega$ , to 47 k $\Omega$ . Table 2 summarizes the frequency response characteristics of each configuration.

**Table 2. COMMON LOAD IMPEDANCES VS LOW FREQUENCY OUTPUT CHARACTERISTICS IN SE MODE**

$R_L$ ( $\Omega$ )	$C_C$ ( $\mu\text{F}$ )	LOWEST FREQUENCY( Hz)
3	330	161
4	330	120
8	330	60
32	330	15
10,000	330	0.05
47,000	330	0.01

As Table 2 indicates, most of the bass response is attenuated into a 4- $\Omega$  load, an 8- $\Omega$  load is adequate, headphone response is good, and drive into line level inputs (a home stereo, for example) is exceptional.

## USING LOW-ESR CAPACITORS

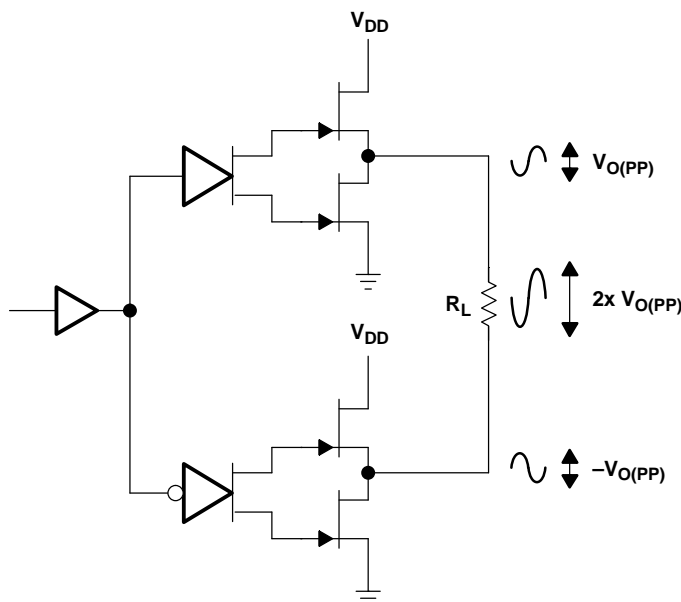

Low-ESR capacitors are recommended throughout this applications section. A real (as opposed to ideal) capacitor can be modeled simply as a resistor in series with an ideal capacitor. The voltage drop across this resistor minimizes the beneficial effects of the capacitor in the circuit. The lower the equivalent value of this resistance, the more the real capacitor behaves like an ideal capacitor.

## BRIDGE-TIED LOAD VERSUS SINGLE-ENDED MODE

Figure 39 shows a Class-AB audio power amplifier (APA) in a BTL configuration. The TPA0312 BTL amplifier consists of two Class-AB amplifiers driving both ends of the load. There are several potential benefits to this differential drive configuration, but initially consider power to the load. The differential drive to the speaker means that as one side is slewing up, the other side is slewing down, and vice versa. This in effect doubles the voltage swing on the load as compared to a ground-referenced load. Plugging  $2 \times V_{O(PP)}$  into the power equation, where voltage is squared, yields  $4 \times$  the output power from the same supply rail and load impedance (see Equation 5).

$$V_{(rms)} = \frac{V_{O(PP)}}{2\sqrt{2}}$$

$$\text{Power} = \frac{V_{(rms)}^2}{R_L} \quad (5)$$

**Figure 39. Bridge-Tied Load Configuration**

In a typical computer sound channel operating at 5 V, bridging raises the power into an 8-Ω speaker from a singled-ended (SE, ground reference) limit of 250 mW to 1 W. In sound power that is a 6-dB improvement—which is loudness that can be heard. In addition to increased power, there are frequency response concerns. Consider the single-supply SE configuration shown in Figure 40. A coupling capacitor is required to block the dc offset voltage from reaching the load. These capacitors can be quite large (approximately 33 μF to 1000 μF); so, they tend to be expensive, heavy, occupy valuable PCB area, and have the additional drawback of limiting low-frequency performance of the system. This frequency limiting effect is due to the high-pass filter network created with the speaker impedance and the coupling capacitance and is calculated with Equation 6.

$$f_c = \frac{1}{2\pi R_L C_C} \quad (6)$$

For example, a 68-μF capacitor with an 8-Ω speaker would attenuate low frequencies below 293 Hz. The BTL configuration cancels the dc offsets, which eliminates the need for the blocking capacitors. Low-frequency performance is then limited only by the input network and speaker response. Cost and PCB space are also minimized by eliminating the bulky coupling capacitor.

Figure 40. Single-Ended Configuration and Frequency Response

Increasing power to the load does carry a penalty of increased internal power dissipation. The increased dissipation is understandable considering that the BTL configuration produces 4× the output power of the SE configuration. Internal dissipation versus output power is discussed further in the *Crest Factor and Thermal Considerations* section.

### SINGLE-ENDED OPERATION

In SE mode the load is driven from the primary amplifier output for each channel (OUT+, terminals 21 and 4).

The amplifier switches single-ended operation when the SE/BTL terminal is held high. This puts the negative outputs in a high-impedance state, and reduces the amplifier's gain to 4.1 dB.

### BTL AMPLIFIER EFFICIENCY

Class-AB amplifiers are notoriously inefficient. The primary cause of these inefficiencies is voltage drop across the output stage transistors. There are two components of the internal voltage drop. One is the headroom or dc voltage drop that varies inversely to output power. The second component is due to the sine-wave nature of the output. The total voltage drop can be calculated by subtracting the RMS value of the output voltage from  $V_{DD}$ . The internal voltage drop multiplied by the RMS value of the supply current,  $I_{DD,rms}$ , determines the internal power dissipation of the amplifier.

An easy-to-use equation to calculate efficiency starts out as being equal to the ratio of power from the power supply to the power delivered to the load. To accurately calculate the RMS and average values of power in the load and in the amplifier, the current and voltage waveform shapes must first be understood (see Figure 41).

Figure 41. Voltage and Current Waveforms for BTL Amplifiers

Although the voltages and currents for SE and BTL are sinusoidal in the load, currents from the supply are different between SE and BTL configurations. In an SE application, the current waveform is a half-wave rectified shape, whereas in BTL it is a full-wave rectified waveform. This means RMS conversion factors are different. Keep in mind that for most of the waveform both the push and pull transistors are not on at the same time, which supports the fact that each amplifier in the BTL device only draws current from the supply for half the waveform. The following equations are the basis for calculating amplifier efficiency.

$$\text{Efficiency of a BTL amplifier} = \frac{P_L}{P_{SUP}}$$

Where:

$$P_L = \frac{V_{L\text{rms}}^2}{R_L}, \text{ and } V_{LRMS} = \frac{V_P}{\sqrt{2}}, \text{ therefore, } P_L = \frac{V_P^2}{2R_L}$$

$$\text{and } P_{SUP} = V_{DD} I_{DD\text{avg}} \text{ and } I_{DD\text{avg}} = \frac{1}{\pi} \int_0^\pi \frac{V_P}{R_L} \sin(t) dt = -\frac{1}{\pi} \times \frac{V_P}{R_L} [\cos(t)]_0^\pi = \frac{2V_P}{\pi R_L}$$

Therefore,

$$P_{SUP} = \frac{2 V_{DD} V_P}{\pi R_L}$$

substituting  $P_L$  and  $P_{SUP}$  into Equation 7,

$$\text{Efficiency of a BTL amplifier} = \frac{\frac{V_P^2}{2 R_L}}{\frac{2 V_{DD} V_P}{\pi R_L}} = \frac{\pi V_P}{4 V_{DD}}$$

Where:

$$V_P = \sqrt{2 P_L R_L}$$

Therefore,

$$\eta_{BTL} = \frac{\pi \sqrt{2 P_L R_L}}{4 V_{DD}}$$

- $P_L$  = Power delivered to load
- $P_{SUP}$  = Power drawn from power supply
- $V_{LRMS}$  = RMS voltage on BTL load
- $R_L$  = Load resistance
- $V_P$  = Peak voltage on BTL load
- $I_{DD\text{avg}}$  = Average current drawn from the power supply
- $V_{DD}$  = Power supply voltage
- $\eta_{BTL}$  = Efficiency of a BTL amplifier

(7)

(8)

Table 3 employs Equation 8 to calculate efficiencies for four different output power levels. Note that the efficiency of the amplifier is quite low for lower power levels and rises sharply as power to the load is increased resulting in a nearly flat internal power dissipation over the normal operating range. Note that the internal dissipation at full output power is less than in the half-power range. Calculating the efficiency for a specific system is the key to proper power supply design. For a stereo 1-W audio system with 8-Ω loads and a 5-V supply, the maximum draw on the power supply is almost 3.25 W.

**Table 3. EFFICIENCY VS OUTPUT POWER IN 5-V, 8-Ω, BTL SYSTEMS**

OUTPUT POWER (W)	EFFICIENCY (%)	PEAK VOLTAGE (V)	INTERNAL DISSIPATION (W)
0.25	31.4	2.00	0.55
0.50	44.4	2.83	0.62
1.00	62.8	4.00	0.59
1.25	70.2	4.47 <sup>(1)</sup>	0.53

(1) High peak voltages cause the THD to increase.

A final point to remember about Class-AB amplifiers (either SE or BTL) is how to manipulate the terms in the efficiency equation to utmost advantage when possible. Note that in Equation 8,  $V_{DD}$  is in the denominator. This indicates that as  $V_{DD}$  goes down, efficiency goes up.

## CREST FACTOR AND THERMAL CONSIDERATIONS

Class-AB power amplifiers dissipate a significant amount of heat in the package under normal operating conditions. A typical music CD requires 12 dB to 15 dB of dynamic range, or headroom above the average power output, to pass the loudest portions of the signal without distortion. In other words, music typically has a crest factor between 12 dB and 15 dB. When determining the optimal ambient operating temperature, the internal dissipated power at the average output power level must be used. From the TPA0312 data sheet, one can see that when the TPA0312 is operating from a 5-V supply into a 3- $\Omega$  speaker, 4-W peaks are available. Converting watts to dB:

$$P_{dB} = 10\text{Log} \frac{P_W}{P_{ref}} = 10\text{Log} \frac{4\text{ W}}{1\text{ W}} = 6\text{ dB} \quad (9)$$

Subtracting the headroom restriction to obtain the average listening level without distortion yields:

- 6 dB - 15 dB = -9 dB (15-dB crest factor)
- 6 dB - 12 dB = -6 dB (12-dB crest factor)
- 6 dB - 9 dB = -3 dB (9-dB crest factor)
- 6 dB - 6 dB = 0 dB (6-dB crest factor)
- 6 dB - 3 dB = 3 dB (3-dB crest factor)

Converting dB back into watts:

$$\begin{aligned} P_W &= 10^{P_{dB}/10} \times P_{ref} \\ &= 63\text{ mW (18-dB crest factor)} \\ &= 125\text{ mW (15-dB crest factor)} \\ &= 250\text{ mW (9-dB crest factor)} \\ &= 500\text{ mW (6-dB crest factor)} \\ &= 1000\text{ mW (3-dB crest factor)} \\ &= 2000\text{ mW (15-dB crest factor)} \end{aligned} \quad (10)$$

This is valuable information to consider when attempting to estimate the heat dissipation requirements for the amplifier system. Comparing the absolute worst case, which is 2 W of continuous power output with a 3-dB crest factor, against 12-dB and 15-dB applications drastically affects maximum ambient temperature ratings for the system. Using the power dissipation curves for a 5-V, 3-Ω system, the internal dissipation in the TPA0312 and maximum ambient temperatures is shown in Table 4.

**Table 4. TPA0312 POWER RATING, 5-V, 3-Ω, STEREO**

PEAK OUTPUT POWER (W)	AVERAGE OUTPUT POWER	POWER DISSIPATION (W/Channel)	MAXIMUM AMBIENT TEMPERATURE <sup>(1)</sup>
4	2 W (3 dB)	1.7	-3°C
4	1000 mW (6 dB)	1.6	6°C
4	500 mW (9 dB)	1.4	24°C
4	250 mW (12 dB)	1.1	51°C
4	125 mW (15 dB)	0.8	78°C
4	63 mW (18 dB)	0.6	85°C

(1) Package limited to 85°C ambient

**Table 5. TPA0312 POWER RATING, 5-V, 8-Ω, STEREO**

PEAK OUTPUT POWER	AVERAGE OUTPUT POWER	POWER DISSIPATION (W/Channel)	MAXIMUM AMBIENT TEMPERATURE <sup>(1)</sup>
2.5 W	1250 mW (3-dB crest factor)	0.55	85°C
2.5 W	1000 mW (4-dB crest factor)	0.62	85°C
2.5 W	500 mW (7-dB crest factor)	0.59	85°C
2.5 W	250 mW (10-dB crest factor)	0.53	85°C

(1) Package limited to 85°C ambient

The maximum dissipated power,  $P_{Dmax}$ , is reached at a much lower output power level for a 3-Ω load than for an 8-Ω load. As a result, this simple formula for calculating  $P_{Dmax}$  may be used for a 3-Ω application:

$$P_{Dmax} = \frac{2V_{DD}^2}{\pi^2 R_L} \tag{11}$$

However, in the case of an 8-Ω load, the  $P_{Dmax}$  occurs at a point well above the normal operating power level. The amplifier may therefore be operated at a higher ambient temperature than required by the  $P_{Dmax}$  formula for an 8-Ω load, but do not exceed the maximum ambient temperature of 85°C.

The maximum ambient temperature depends on the heat-sinking ability of the PCB system. The derating factor for the PWP package is shown in the dissipation rating table (see page 4). Converting this to  $\theta_{JA}$ :

$$\theta_{JA} = \frac{1}{\text{Derating Factor}} = \frac{1}{0.022} = 45^\circ\text{C/W} \tag{12}$$

To calculate maximum ambient temperatures, first consider that the numbers from the dissipation graphs are per channel so the dissipated power needs to be doubled for two-channel operation. Given  $\theta_{JA}$ , the maximum allowable junction temperature, and the total internal dissipation, the maximum ambient temperature can be calculated with the following equation. The maximum recommended junction temperature for the TPA0312 is 150°C. The internal dissipation figures are taken from the Power Dissipation vs Output Power graphs.

$$\begin{aligned} T_A \text{ Max} &= T_J \text{ Max} - \theta_{JA} P_D \\ &= 150 - 45(0.6 \times 2) = 96^\circ\text{C (15-dB crest factor)} \end{aligned} \tag{13}$$

**NOTE:**

Internal dissipation of 0.6 W is estimated for a 2.6-W system with 15-dB crest factor per channel. Package limited to 85°C

Table 4 and Table 5 show that for some applications no airflow is required to keep junction temperatures in the specified range. The TPA0312 is designed with thermal protection that turns the device off when the junction temperature surpasses 150°C to prevent damage to the IC. Table 4 and Table 5 were calculated for maximum listening volume without distortion. When the output level is reduced the numbers in the table change significantly. Also, using 8-Ω speakers dramatically increases the thermal performance by increasing amplifier efficiency.

## SE/BTL OPERATION

The ability of the TPA0312 to easily switch between BTL and SE modes is one of its most important cost-saving features. This feature eliminates the requirement for an additional headphone amplifier in applications where internal stereo speakers are driven in BTL mode but external headphone or speakers must be accommodated. Internal to the TPA0312, two separate amplifiers drive OUT+ and OUT-. The SE/BTL input (terminal 15) controls the operation of the follower amplifier that drives LOUT- and ROUT- (terminals 9 and 16). When SE/BTL is held low, the amplifier is on and the TPA0312 is in the BTL mode. When SE/BTL is held high, the OUT- amplifiers are in a high-output impedance state, which configures the TPA0312 as an SE driver from LOUT+ and ROUT+ (terminals 4 and 21).  $I_{DD}$  is reduced by approximately one-half in SE mode. Control of the SE/BTL input can be from a logic-level CMOS source or, more typically, from a resistor divider network as shown in Figure 42.

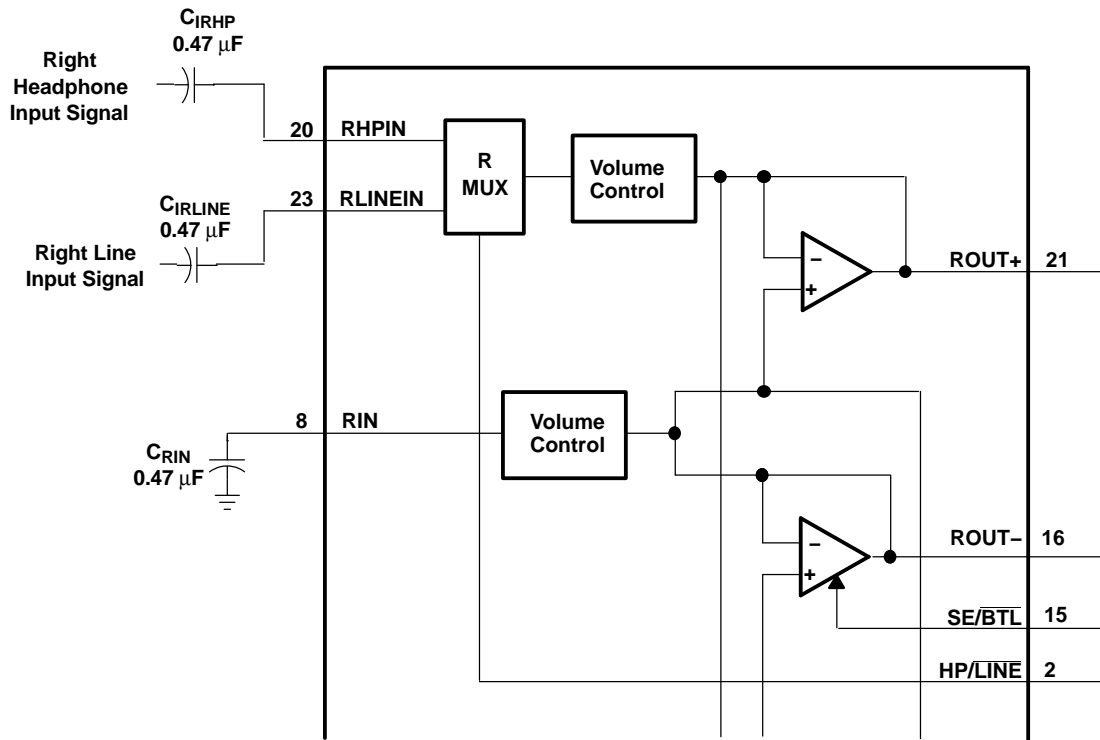

Figure 42. TPA0312 Resistor Divider Network Circuit

Using a readily available 1/8-in. (3,5-mm) stereo headphone jack, the control switch is closed when no plug is inserted. When closed, the 100-kΩ/1-kΩ divider pulls the SE/BTL input low. When a plug is inserted, the 1-kΩ resistor is disconnected and the SE/BTL input is pulled high. When the input goes high, the OUT- amplifier is shut down causing the speaker to mute (virtually open-circuits the speaker). The OUT+ amplifier then drives through the output capacitor ( $C_O$ ) into the headphone jack.

**INPUT MUX OPERATION**

**Figure 43. TPA0312 Example Input MUX Circuit**

The TPA0312 offers the capability for the designer to use separate headphone inputs (RHPIN, LHPIN) and line inputs (RLINEIN, LLINEIN). The inputs can be different if the input signal is single-ended. If using a differential input signal, the inputs must be the same because the inputs share a common RIN, LIN. Although the typical application in Figure 37 shows the input mux control signal HP/LINE tied to SE/BTL, that configuration is not required. The input mux can be used to select between two inputs that are used in both SE and BTL modes.

If using the TPA0312 with a single-ended input, the RIN and LIN terminals must be tied through a capacitor to ground, as shown in Figure 43. RIN and LIN must not be tied to bypass or an offset occurs on the output causing the device to pop when turning on and off.

Input coupling capacitors can be eliminated when using differential inputs, but are used to obtain maximum output power. If the input capacitors are eliminated, the dc offset must match the voltage on BYPASS or the output power is limited.

## PC-BEEP OPERATION

The PC-BEEP input allows a system beep to be sent directly from a computer through the amplifier to the speakers with few external components. The input is activated automatically. When the PC-BEEP input is active, both LINEIN and HPIN inputs are deselected, and both the left and right channels are driven in BTL mode with the signal from PC-BEEP. The gain from the PC-BEEP input to the speakers is fixed at 0.3 V/V and is independent of the volume setting. When the PC-BEEP input is deselected, the amplifier returns to the previous operating mode and volume setting. Furthermore, if the amplifier is in shutdown mode, activating PC-BEEP takes the device out of shutdown, outputs the PC-BEEP signal, then returns the amplifier to shutdown mode.

The preferred input signal is a square wave or pulse train. To be accurately detected, the signal must have a minimum of  $1.5 \cdot V_{pp}$  amplitude, rise and fall times of less than  $0.1 \mu s$  and a minimum of eight rising edges. When the signal is no longer detected, the amplifier returns to its previous operating mode and volume setting.

To ac-couple the PC-BEEP input, choose a coupling-capacitor value to satisfy Equation 14:

$$C_{PCB} \geq \frac{1}{2\pi f_{PCB} (100 \text{ k}\Omega)} \quad (14)$$

The PC-BEEP input can also be dc-coupled to avoid using this coupling capacitor. The pin normally rests at midrail when no signal is present.

## SHUTDOWN MODES

The TPA0312 employs a shutdown mode of operation designed to reduce supply current,  $I_{DD}$ , to the absolute minimum level during periods of nonuse for battery-power conservation. The **SHUTDOWN** input terminal should be held high during normal operation when the amplifier is in use. Pulling **SHUTDOWN** low causes the outputs to mute and the amplifier to enter a low-current state,  $I_{DD} = 150 \mu A$ . **SHUTDOWN** should never be left unconnected because amplifier operation would be unpredictable.

**Table 6. HP/LINE, SE/BTL, AND SHUTDOWN FUNCTIONS**

INPUTS <sup>(1)</sup>			AMPLIFIER STATE	
HP/LINE	SE/BTL	SHUTDOWN	INPUT	OUTPUT
X <sup>(2)</sup>	X <sup>(2)</sup>	Low	X <sup>(2)</sup>	Mute
Low	Low	High	Line	BTL
Low	High	High	Line	SE
High	Low	High	HP	BTL
High	High	High	HP	SE

(1) Inputs should never be left unconnected.

(2) X = do not care

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPA0312PWP	ACTIVE	HTSSOP	PWP	24	60	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPA0312	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# THERMAL PAD MECHANICAL DATA

## PWP (R-PDSO-G24) PowerPAD™ SMALL PLASTIC OUTLINE

### THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

PowerPAD™ PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
