

## TPA2005D1-Q1 1.4-W Mono Filter-Free Class-D Audio Power Amplifier

### 1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
  - Device Temperature Grade 3 (DRB and DGN package non T-suffix):  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  Ambient Operating Temperature Range
  - Device Temperature Grade 2 (DGN package T-suffix):  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$  Ambient Operating Temperature Range
  - Device HBM Classification Level 2
  - Device CDM Classification Level C5
- 1.4 W Into  $8\ \Omega$  From a 5-V Supply at THD = 10% (Typical)
- Maximum Battery Life and Minimum Heat
  - Efficiency With an  $8\text{-}\Omega$  Speaker:
    - 84% at 400 mW
    - 79% at 100 mW
  - 2.8-mA Quiescent Current
  - 0.5- $\mu\text{A}$  Shutdown Current
- Only Three External Components
  - Optimized PWM Output Stage Eliminates LC Output Filter
  - Internally Generated 250-kHz Switching Frequency Eliminates Capacitor and Resistor
  - Improved PSRR ( $-71\ \text{dB}$  at 217 Hz) and Wide Supply Voltage (2.5 V to 5.5 V) Eliminates Need for a Voltage Regulator
  - Fully Differential Design Reduces RF Rectification and Eliminates Bypass Capacitor
  - Improved CMRR Eliminates Two Input Coupling Capacitors
- Space-Saving Packages

- 3 mm  $\times$  3 mm SON package (DRB)
- 3 mm  $\times$  5 mm MSOP-PowerPAD™ Package (DGN)

### 2 Applications

- Cluster
- Head Unit
- Telematics
- Emergency Call (eCall)
- Noise Generator

### 3 Description

The TPA2005D1-Q1 device is a 1.4-W high-efficiency filter-free class-D audio power amplifier in a SON or MSOP-PowerPAD package that requires only three external components.

Features like 84% efficiency,  $-71\text{-dB}$  PSRR at 217 Hz, improved RF-rectification immunity, and  $15\text{-mm}^2$  total PCB area make TPA2005D1-Q1 ideal for low-power audio applications in infotainment and cluster.

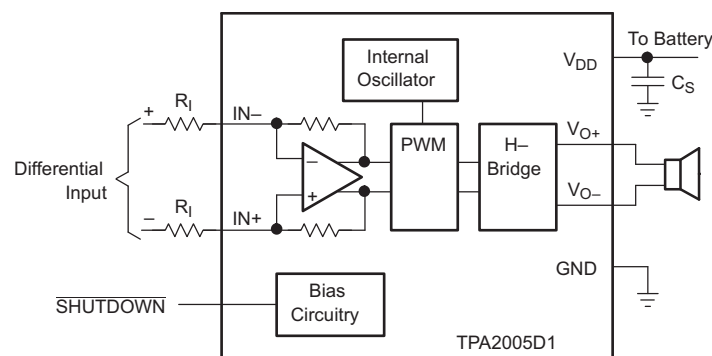

The device allows for independent gain control by summing the signals from each function while minimizing noise to only  $48\ \mu\text{V}_{\text{RMS}}$ . Additionally, the TPA2005D1-Q1 device offers fast start-up time of 9 ms with minimal pop and has short circuit and thermal protection.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPA2005D1-Q1	MSOP-PowerPAD (8)	3.00 mm $\times$ 3.00 mm
	SON (8)	3.00 mm $\times$ 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision D (December 2015) to Revision E	Page
<ul style="list-style-type: none"> <li>• Changed the <math>\theta_{JA}</math> value and resulting value maximum ambient-temperature equation in the <i>Efficiency and Thermal Information</i> section ..... 13</li> </ul>	13

Changes from Revision C (March 2010) to Revision D	Page
<ul style="list-style-type: none"> <li>• Added <i>Applications</i>, <i>ESD Rating</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i>, <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section. .... 1</li> <li>• Deleted Ordering Information table. See POA in the back of document. .... 1</li> <li>• Added <math>R_L</math> Load resistance, to the Abs Max Ratings Table ..... 4</li> <li>• Changed Storage temperature From: -65°C to 85°C To: -65°C to 150°C ..... 4</li> <li>• Deleted Dissipation Ratings table and added Thermal Information table. .... 4</li> <li>• Updated <i>Efficiency and Thermal Information</i> ..... 13</li> </ul>	13

## 5 Device Comparison Table

DEVICE NUMBER	SPEAKER CHANNELS	SPEAKER AMP TYPE	OUTPUT POWER (W)	PSRR (dB)	SUPPLY MIN (V)	SUPPLY MAX (V)
TPA2005D1-Q1	Mono	Class D	1.4	75	2.5	5.5
TPA2000D1-Q1	Mono	Class D	2	77	2.7	5.5

## 6 Pin Configuration and Functions

The thermal pad of the DRB and DGN packages must be electrically and thermally connected to a ground plane.

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
IN–	4	I	Negative differential input
IN+	3	I	Positive differential input
V <sub>DD</sub>	6	I	Power supply
V <sub>O+</sub>	5	O	Positive BTL output
GND	7	I	High-current ground
V <sub>O–</sub>	8	O	Negative BTL output
SHUTDOWN	1	I	Shutdown terminal (active low logic)
NC	2	—	No internal connection
Thermal Pad		—	Must be soldered to a grounded pad on the PCB.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT	
V <sub>DD</sub>	Supply voltage <sup>(2)</sup>	In active mode	-0.3	6	V
		In $\overline{\text{SHUTDOWN}}$ mode	-0.3	7	V
V <sub>I</sub>	Input voltage	-0.3	V <sub>DD</sub> + 0.3 V	V	
R <sub>L</sub>	Load resistance	2.5 ≤ V <sub>DD</sub> ≤ 4.2 V	3.2		Ω
		4.2 < V <sub>DD</sub> ≤ 6 V	6.4		Ω
T <sub>A</sub>	Operating free-air temperature	Non T-suffix	-40	85	°C
		T-suffix	-40	105	
T <sub>J</sub>	Operating junction temperature	-40	150	°C	
T <sub>stg</sub>	Storage temperature	-65	150	°C	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) For the MSOP (DGN) package option, the maximum V<sub>DD</sub> should be limited to 5 V if short-circuit protection is desired.

### 7.2 ESD Ratings

		VALUE	UNIT	
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per AEC Q100-011	±1000	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 7.3 Recommended Operating Conditions

		MIN	MAX	UNIT	
V <sub>DD</sub>	Supply voltage	2.5	5.5	V	
V <sub>IH</sub>	High-level input voltage	$\overline{\text{SHUTDOWN}}$	V <sub>DD</sub>	V	
V <sub>IL</sub>	Low-level input voltage	$\overline{\text{SHUTDOWN}}$	0.7	V	
R <sub>I</sub>	Input resistor	Gain ≤ 20 V/V (26 dB)	15	kΩ	
V <sub>IC</sub>	Common-mode input voltage	V <sub>DD</sub> = 2.5 V, 5.5 V, CMRR ≤ -49 dB	0.5	V <sub>DD</sub> - 0.8	V
T <sub>A</sub>	Operating free-air temperature	Non T-suffix	-40	85	°C
		T-suffix	-40	105	

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPA2005D1-Q1		UNIT
		DRB (SON)	DGN (MSOP PowerPAD)	
		8 PINS	8 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	49.5	57	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	62.1	53.8	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	24.8	33.7	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	1.3	1.9	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	24.9	33.4	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	6.9	6.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 7.5 Electrical Characteristics

 $T_A = -40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$ V_{OS} $	Output offset voltage (measured differentially)	$V_I = 0\text{ V}$ , $A_V = 2\text{ V/V}$ , $V_{DD} = 2.5\text{ V}$ to $5.5\text{ V}$			25	mV
PSRR	Power-supply rejection ratio	$V_{DD} = 2.5\text{ V}$ to $5.5\text{ V}$		-75	-55	dB
CMRR	Common-mode rejection ratio	$V_{DD} = 2.5\text{ V}$ to $5.5\text{ V}$ , $V_{IC} = V_{DD} / 2$ to $0.5\text{ V}$ , $V_{IC} = V_{DD} / 2$ to $V_{DD} - 0.8\text{ V}$	$T_A = 25^{\circ}\text{C}$	-68	-49	dB
			$T_A = -40^{\circ}\text{C}$ to $85^{\circ}\text{C}$		-35	
$ I_{IH} $	High-level input current	$V_{DD} = 5.5\text{ V}$ , $V_I = 5.8\text{ V}$			50	$\mu\text{A}$
$ I_{IL} $	Low-level input current	$V_{DD} = 5.5\text{ V}$ , $V_I = 0.3\text{ V}$	$T_A = -40^{\circ}\text{C}$ to $85^{\circ}\text{C}$		4	$\mu\text{A}$
			$T_A = -40^{\circ}\text{C}$ to $105^{\circ}\text{C}$		12	
$I_{(Q)}$	Quiescent current	$V_{DD} = 5.5\text{ V}$ , no load		3.4	4.5	mA
		$V_{DD} = 3.6\text{ V}$ , no load		2.8		
		$V_{DD} = 2.5\text{ V}$ , no load		2.2	3.2	
$I_{(SD)}$	Shutdown current	$V_{(SHUTDOWN)} = 0.8\text{ V}$ , $V_{DD} = 2.5\text{ V}$ to $5.5\text{ V}$	$T_A = -40^{\circ}\text{C}$ to $85^{\circ}\text{C}$	0.5	2	$\mu\text{A}$
			$T_A = -40^{\circ}\text{C}$ to $105^{\circ}\text{C}$		2.5	
$r_{DS(on)}$	Static drain-source on-state resistance	$V_{DD} = 2.5\text{ V}$		770		m $\Omega$
		$V_{DD} = 3.6\text{ V}$		590		
		$V_{DD} = 5.5\text{ V}$		500		
	Output impedance in SHUTDOWN	$V_{(SHUTDOWN)} = 0.8\text{ V}$		>1		k $\Omega$
$f_{(sw)}$	Switching frequency	$V_{DD} = 2.5\text{ V}$ to $5.5\text{ V}$	200	250	300	kHz
	Gain		$2 \times \frac{142\text{ k}\Omega}{R_I}$	$2 \times \frac{150\text{ k}\Omega}{R_I}$	$2 \times \frac{158\text{ k}\Omega}{R_I}$	$\frac{V}{V}$

## 7.6 Operating Characteristics

 $T_A = 25^{\circ}\text{C}$ , Gain =  $2\text{ V/V}$ ,  $R_L = 8\ \Omega$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$P_O$	Output power	THD + N = 1%, $f = 1\text{ kHz}$ , $R_L = 8\ \Omega$	$V_{DD} = 5\text{ V}$		1.18	W
			$V_{DD} = 3.6\text{ V}$		0.58	
			$V_{DD} = 2.5\text{ V}$		0.26	
		THD + N = 10%, $f = 1\text{ kHz}$ , $R_L = 8\ \Omega$	$V_{DD} = 5\text{ V}$		1.45	
			$V_{DD} = 3.6\text{ V}$		0.75	
			$V_{DD} = 2.5\text{ V}$		0.35	
THD+N	Total harmonic distortion plus noise	$P_O = 1\text{ W}$ , $f = 1\text{ kHz}$ , $R_L = 8\ \Omega$	$V_{DD} = 5\text{ V}$		0.18%	
		$P_O = 0.5\text{ W}$ , $f = 1\text{ kHz}$ , $R_L = 8\ \Omega$	$V_{DD} = 3.6\text{ V}$		0.19%	
		$P_O = 200\text{ mW}$ , $f = 1\text{ kHz}$ , $R_L = 8\ \Omega$	$V_{DD} = 2.5\text{ V}$		0.20%	
$k_{SVR}$	Supply ripple rejection ratio	$f = 217\text{ Hz}$ , $V_{(RIPPLE)} = 200\text{ mV}_{pp}$ , Inputs ac-grounded with $C_I = 2\ \mu\text{F}$	$V_{DD} = 3.6\text{ V}$		-71	dB
SNR	Signal-to-noise ratio	$P_O = 1\text{ W}$ , $R_L = 8\ \Omega$	$V_{DD} = 5\text{ V}$		97	dB
$V_n$	Output voltage noise	$V_{DD} = 3.6\text{ V}$ , $f = 20\text{ Hz}$ to $20\text{ kHz}$ , Inputs ac-grounded with $C_I = 2\ \mu\text{F}$	No weighting		48	$\mu\text{V}_{RMS}$
			A weighting		36	
CMRR	Common-mode rejection ratio	$V_{IC} = 1\text{ V}_{pp}$ , $f = 217\text{ Hz}$	$V_{DD} = 3.6\text{ V}$		-63	dB
$Z_I$	Input impedance		142	150	158	k $\Omega$
	Start-up time from shutdown		$V_{DD} = 3.6\text{ V}$		9	ms

## 8 Parameter Measurement Information

Copyright © 2016, Texas Instruments Incorporated

- A.  $C_1$  was shorted for any common-mode input voltage measurement.
- B. A 33- $\mu$ H inductor was placed in series with the load resistor to emulate a small speaker for efficiency measurements.
- C. The 30-kHz low-pass filter is required, even if the analyzer has a low-pass filter. An RC filter (100  $\Omega$ , 47 nF) is used on each output for the data sheet graphs.

**Figure 30. Test Setup For Graphs**

## 9 Detailed Description

### 9.1 Overview

The TPA2005D1-Q1 device is a high-efficiency filter-free Class-D audio amplifier capable of delivering up to 1.4 W into 8-Ω loads with a 5-V power supply. The fully-differential design of this amplifier avoids the usage of bypass capacitors and the improved CMRR eliminates the usage of input-coupling capacitors. This makes the device size a perfect choice for small, space constrained applications as only three external components are required. The advanced modulation used in the TPA2005D1-Q1 PWM output stage eliminates the need for an output filter.

### 9.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

### 9.3 Feature Description

#### 9.3.1 Fully Differential Amplifier

The TPA2005D1-Q1 device is a fully differential amplifier with differential inputs and outputs. The fully differential amplifier consists of a differential amplifier and a common-mode amplifier. The differential amplifier ensures that the amplifier outputs a differential voltage on the output that is equal to the differential input times the gain. The common-mode feedback ensures that the common-mode voltage at the output is biased around  $V_{DD} / 2$ , regardless of the common-mode voltage at the input. The fully differential TPA2005D1-Q1 device can still be used with a single-ended input; however, the TPA2005D1-Q1 device should be used with differential inputs when in a noisy environment to ensure maximum noise rejection.

##### 9.3.1.1 Advantages Of Fully Differential Amplifiers

Fully differential amplifiers have the following advantages:

- Input-coupling capacitors not required:
  - The fully differential amplifier allows the inputs to be biased at a voltage other than mid-supply. For example, if a codec has a mid-supply lower than the mid-supply of the TPA2005D1-Q1 device, the common-mode feedback circuit adjusts, and the TPA2005D1-Q1 outputs still is biased at mid-supply of the TPA2005D1-Q1 device. The inputs of the TPA2005D1-Q1 device can be biased from 0.5 V to  $V_{DD} - 0.8$  V. If the inputs are biased outside of that range, input-coupling capacitors are required.
- Mid-supply bypass capacitor,  $C_{(BYPASS)}$ , not required:
  - The fully differential amplifier does not require a bypass capacitor. This is because any shift in the mid-supply affects both positive and negative channels equally and cancels at the differential output.

## Feature Description (continued)

- Better RF immunity:
  - The fully differential amplifier cancels noise from RF interference much better than the typical audio amplifier.

### 9.3.2 Efficiency and Thermal Information

As an example, the DRB package has a  $R_{\theta JA}$  of 49.5°C/W, the maximum allowable junction temperature of 150°C, and a maximum internal dissipation of 0.2 W (worst case 5-V supply and 8-Ω load). Use Equation 1 to calculate the maximum ambient temperature.

$$T_{A\text{Max}} = T_{J\text{Max}} - R_{\theta JA} P_{D\text{max}} = 150 - 49.5(0.2) = 140.1^\circ\text{C} \quad (1)$$

Equation 1 shows that the calculated maximum ambient temperature is 140.1°C at maximum power dissipation with a 5-V supply; however, the maximum ambient temperature of the package is limited to 85°C (note that the TPA2005D1TDG NRQ1 supports up to 105°C). Because of the efficiency of the TPA2005D1-Q1, it can operate under all conditions to an ambient temperature of 85°C. The TPA2005D1-Q1 is designed with thermal protection that turns the device off when the junction temperature surpasses 150°C to prevent damage to the IC. Also, using speakers more resistive than 8 Ω dramatically increases the thermal performance by reducing the output current and increasing the efficiency of the amplifier.

### 9.3.3 Eliminating the Output Filter With the TPA2005D1-Q1

This section focuses on why the user can eliminate the output filter with the TPA2005D1-Q1.

#### 9.3.3.1 Effect On Audio

The class-D amplifier outputs a pulse-width modulated (PWM) square wave, which is the sum of the switching waveform and the amplified input audio signal. The human ear acts as a band-pass filter such that only the frequencies between approximately 20 Hz and 20 kHz are passed. The switching frequency components are much greater than 20 kHz, so the only signal heard is the amplified input audio signal.

#### 9.3.3.2 Traditional Class-D Modulation Scheme

The traditional class-D modulation scheme has a differential output in which each output is 180 degrees out of phase and changes from ground to the supply voltage,  $V_{DD}$ . Therefore, the differential pre-filtered output varies between positive and negative  $V_{DD}$ , where filtered 50% duty cycle yields 0 V across the load. The traditional class-D modulation scheme with voltage and current waveforms is shown in Figure 31. Note that, even at an average of 0 V across the load (50% duty cycle), the current to the load is high, causing a high loss and thus causing a high supply current.

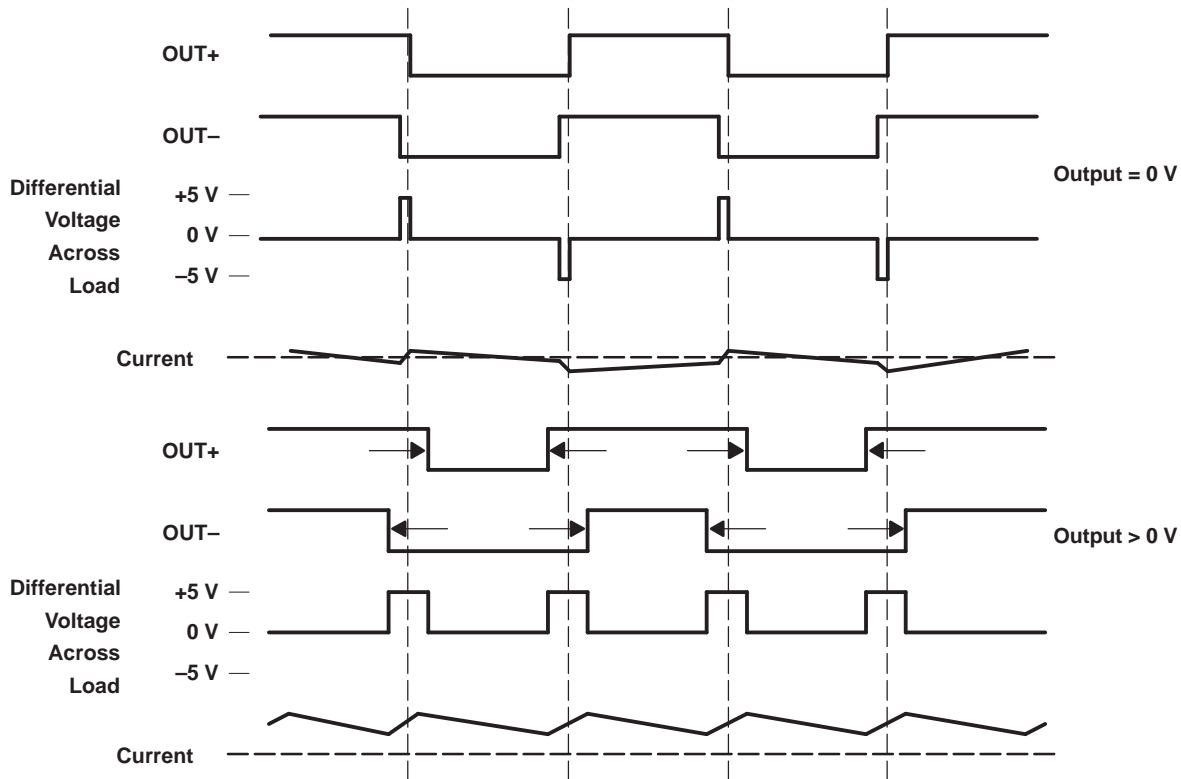

**Figure 31. Traditional Class-D Modulation Scheme Output Voltage and Current Waveforms Into an Inductive Load With No Input**

## Feature Description (continued)

### 9.3.3.3 TPA2005D1-Q1 Modulation Scheme

The TPA2005D1-Q1 device uses a modulation scheme that still has each output switching from 0 to the supply voltage. However, OUT+ and OUT– are now in phase with each other, with no input. The duty cycle of OUT+ is greater than 50% and OUT– is less than 50% for positive voltages. The duty cycle of OUT+ is less than 50% and OUT– is greater than 50% for negative voltages. The voltage across the load remains at 0 V throughout most of the switching period, greatly reducing the switching current, which reduces any  $I^2R$  losses in the load.

**Figure 32. TPA2005D1-Q1 Output Voltage and Current Waveforms Into an Inductive Load**

### 9.3.3.4 Efficiency: Why You Must Use a Filter With The Traditional Class-D Modulation Scheme

The main reason that the traditional class-D amplifier needs an output filter is that the switching waveform results in maximum current flow. This causes more loss in the load, which causes lower efficiency. The ripple current is large for the traditional modulation scheme because the ripple current is proportional to voltage multiplied by the time at that voltage. The differential voltage swing is  $2 \times V_{DD}$ , and the time at each voltage is one-half the period for the traditional modulation scheme. An ideal LC filter is needed to store the ripple current from each half-cycle for the next half-cycle, while any resistance causes power dissipation. The speaker is both resistive and reactive, whereas an LC filter is almost purely reactive.

The TPA2005D1-Q1 modulation scheme has very little loss in the load without a filter because the pulses are very short and the change in voltage is  $V_{DD}$  instead of  $2 \times V_{DD}$ . As the output power increases, the pulses widen, making the ripple current larger. Ripple current could be filtered with an LC filter for increased efficiency, but for most applications the filter is not needed.

An LC filter with a cutoff frequency less than the class-D switching frequency allows the switching current to flow through the filter instead of the load. The filter has less resistance than the speaker, resulting in less power dissipation, which increases efficiency.

## Feature Description (continued)

### 9.3.3.5 Effects Of Applying a Square Wave Into a Speaker

If the amplitude of a square wave is high enough and the frequency of the square wave is within the bandwidth of the speaker, a square wave could cause the voice coil to jump out of the air gap, scar the voice coil, or both. A 250-kHz switching frequency, however, is not significant because the speaker cone movement is proportional to  $1/f^2$  for frequencies beyond the audio band. Therefore, the amount of cone movement at the switching frequency is very small. However, damage could occur to the speaker if the voice coil is not designed to handle the additional power. To size the speaker for added power, the ripple current dissipated in the load must be calculated by subtracting the theoretical supplied power,  $P_{SUP\ THEORETICAL}$ , from the actual supply power,  $P_{SUP}$ , at maximum output power,  $P_{OUT}$ . The switching power dissipated in the speaker is the inverse of the measured efficiency,  $\eta_{MEASURED}$ , minus the theoretical efficiency,  $\eta_{THEORETICAL}$ .

$$P_{SPKR} = P_{SUP} - P_{SUP\ THEORETICAL} \quad (\text{at max output power}) \quad (2)$$

$$P_{SPKR} = \frac{P_{SUP}}{P_{OUT}} - \frac{P_{SUP\ THEORETICAL}}{P_{OUT}} \quad (\text{at max output power}) \quad (3)$$

$$P_{SPKR} = P_{OUT} \left( \frac{1}{\eta_{MEASURED}} - \frac{1}{\eta_{THEORETICAL}} \right) \quad (\text{at max output power}) \quad (4)$$

$$\eta_{THEORETICAL} = \frac{R_L}{R_L + 2r_{DS(on)}} \quad (\text{at max output power}) \quad (5)$$

The maximum efficiency of the TPA2005D1-Q1 device with a 3.6-V supply and an 8-Ω load is 86% from Equation 5. Using Equation 4 with the efficiency at maximum power (84%). An additional 17 mW is dissipated in the speaker. The added power dissipated in the speaker is not an issue as long as it is taken into account when choosing the speaker.

### 9.3.3.6 When to Use an Output Filter

Design the TPA2005D1-Q1 device without an output filter if the traces from amplifier to speaker are short. The TPA2005D1-Q1 device passed FCC and CE radiated emissions with no shielding and with speaker trace wires 100 mm long or less.

A ferrite bead filter often can be used if the design is failing radiated emissions without an LC filter, and the frequency-sensitive circuit is greater than 1 MHz. If choosing a ferrite bead, choose one with high impedance at high frequencies, but very low impedance at low frequencies.

Use an LC output filter if there are low-frequency (<1 MHz) EMI-sensitive circuits and/or there are long leads from amplifier to speaker.

Figure 33 and Figure 34 show typical ferrite bead and LC output filters.

## 9.4 Device Functional Modes

### 9.4.1 Summing Input Signals With the TPA2005D1-Q1

The TPA2005D1-Q1 device makes it easy to sum signal sources or use separate signal sources with different gains. This allows one speaker to be connected to the TPA2005D1-Q1 device with multiple input sources. It can also be used to output a stereo signal to a mono speaker by summing the left and right channels.

#### 9.4.1.1 Summing Two Differential Input Signals

Two extra resistors are required for summing differential signals (a total of 5 components). The gain for each input source can be set independently (see Equation 6 and Equation 7 and Figure 35).

$$\text{Gain 1} = \frac{V_O}{V_{I1}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I1}} \left( \frac{\text{V}}{\text{V}} \right) \quad (6)$$

$$\text{Gain 2} = \frac{V_O}{V_{I2}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I2}} \left( \frac{\text{V}}{\text{V}} \right) \quad (7)$$

If summing left and right inputs with a gain of 1 V/V, use  $R_{I1} = R_{I2} = 300 \text{ k}\Omega$ .

**Figure 35. Application Schematic With TPA2005D1-Q1 Summing Two Differential Inputs**

## Device Functional Modes (continued)

### 9.4.1.2 Summing A Differential Input Signal And A Single-Ended Input Signal

Figure 36 shows how to sum a differential input signal and a single-ended input signal. Ground noise can couple in through IN+ with this method. It is better to use differential inputs. The corner frequency of the single-ended input is set by C<sub>12</sub>, shown in Equation 10. To ensure that each input is balanced, the single-ended input must be driven by a low-impedance source even if the input is not in use.

$$\text{Gain 1} = \frac{V_O}{V_{I1}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I1}} \left( \frac{V}{V} \right) \quad (8)$$

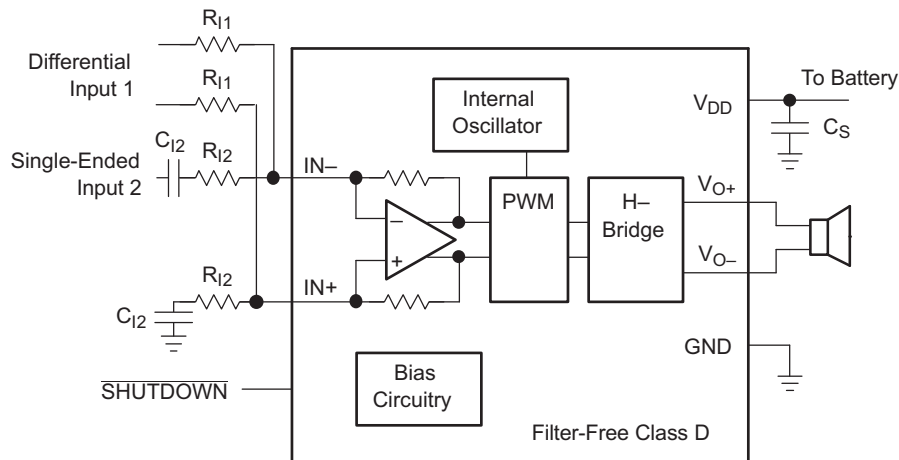

$$\text{Gain 2} = \frac{V_O}{V_{I2}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I2}} \left( \frac{V}{V} \right) \quad (9)$$

$$C_{12} = \frac{1}{(2\pi R_{I2} f_{c2})} \quad (10)$$

The high-pass corner frequency of the single-ended input is set by C<sub>12</sub>. If the desired corner frequency is less than 20 Hz, then:

$$C_{12} > \frac{1}{(2\pi 150 \text{ k}\Omega 20 \text{ Hz})} \quad (11)$$

$$C_{12} > 53 \text{ pF} \quad (12)$$

Copyright © 2016, Texas Instruments Incorporated

**Figure 36. Application Schematic With TPA2005D1-Q1 Summing Differential Input And Single-Ended Input Signals**

### 9.4.1.3 Summing Two Single-Ended Input Signals

Four resistors and three capacitors are needed for summing single-ended input signals. The gain and corner frequencies (f<sub>c1</sub> and f<sub>c2</sub>) for each input source can be set independently (see Equation 13 through Equation 16 and Figure 37). Resistor, R<sub>P</sub>, and capacitor, C<sub>P</sub>, are needed on the IN+ terminal to match the impedance on the IN- terminal. The single-ended inputs must be driven by low-impedance sources, even if one of the inputs is not outputting an AC signal.

$$\text{Gain 1} = \frac{V_O}{V_{I1}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I1}} \left( \frac{V}{V} \right) \quad (13)$$

$$\text{Gain 2} = \frac{V_O}{V_{I2}} = 2 \times \frac{150 \text{ k}\Omega}{R_{I2}} \left( \frac{V}{V} \right) \quad (14)$$

$$C_{11} = \frac{1}{(2\pi R_{I1} f_{c1})} \quad (15)$$

**Device Functional Modes (continued)**

$$C_{I2} = \frac{1}{(2\pi R_{I2} f_{c2})} \quad (16)$$

$$C_P = C_{I1} + C_{I2} \quad (17)$$

$$R_P = \frac{R_{I1} \times R_{I2}}{(R_{I1} + R_{I2})} \quad (18)$$

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

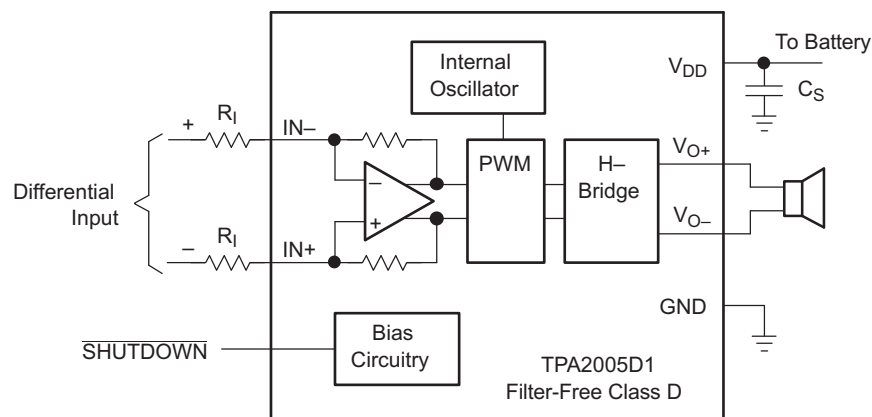

### 10.1 Application Information

These typical connection diagrams highlight the required external components and system level connections for proper operation of the device in several popular use cases.

Each of these configurations can be realized using the Evaluation Modules (EVMS) for the device. These flexible modules allow full evaluation of the device in the most common modes of operation. Any design variation can be supported by TI through schematic and layout reviews. Visit <http://e2e.ti.com> for design assistance.

### 10.2 Typical Application

#### 10.2.1 TPA2005D1-Q1 With Differential Input

Copyright © 2016, Texas Instruments Incorporated

Figure 38. Typical TPA2005D1-Q1 Application Schematic With Differential Input

#### 10.2.1.1 Design Requirements

For this design example, use the parameters listed in [Table 1](#)

Table 1. Design Requirements

PARAMETER	EXAMPLE
Power Supply	5 V
Shutdown Input	High > 2 V
	Low < 0.8 V
Speaker	8 Ω

### 10.2.1.2 Detailed Design Procedure

#### 10.2.1.2.1 Component Selection

Figure 38 shows the TPA2005D1-Q1 typical schematic with differential inputs, and Figure 40 shows the TPA2005D1-Q1 device with differential inputs and input capacitors, and Figure 41 shows the TPA2005D1-Q1 device with single-ended inputs. Differential inputs should be used whenever possible, because the single-ended inputs are much more susceptible to noise.

**Table 2. Typical Component Values**

REF DES	VALUE	EIA SIZE	MANUFACTURER	PART NUMBER
R <sub>I</sub>	150 kΩ (±0.5%)	0402	Panasonic	ERJ2RHD154V
C <sub>S</sub>	1 μF (+22%, –80%)	0402	Murata	GRP155F50J105Z
C <sub>I</sub> <sup>(1)</sup>	3.3 nF (±10%)	0201	Murata	GRP033B10J332K

(1) C<sub>I</sub> is needed only for single-ended input or if V<sub>ICM</sub> is not between 0.5 V and V<sub>DD</sub> – 0.8 V. C<sub>I</sub> = 3.3 nF (with R<sub>I</sub> = 150 kΩ) gives a high-pass corner frequency of 321 Hz.

#### 10.2.1.2.2 Input Resistors (R<sub>I</sub>)

The input resistors (R<sub>I</sub>) set the gain of the amplifier according to equation Equation 19.

$$\text{Gain} = 2 \times \frac{150 \text{ k}\Omega}{R_I} \quad (19)$$

**Resistor matching is very important in fully differential amplifiers.** The balance of the output on the reference voltage depends on matched ratios of the resistors. CMRR, PSRR, and cancellation of the second harmonic distortion diminish if resistor mismatch occurs. Therefore, it is recommended to use 1% tolerance resistors, or better, to keep the performance optimized. Matching is more important than overall tolerance. Resistor arrays with 1% matching can be used with a tolerance greater than 1%.

Place the input resistors very close to the TPA2005D1-Q1 to limit noise injection on the high-impedance nodes.

For optimal performance, the gain should be set to 2 V/V or lower. Lower gain allows the TPA2005D1-Q1 to operate at its best and keeps a high voltage at the input, making the inputs less susceptible to noise.

#### 10.2.1.2.3 Decoupling Capacitor (C<sub>S</sub>)

The TPA2005D1-Q1 is a high-performance class-D audio amplifier that requires adequate power-supply decoupling to ensure the efficiency is high and total harmonic distortion (THD) is low. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically 1 μF, placed as close as possible to the device V<sub>DD</sub> lead, works best. Placing this decoupling capacitor close to the TPA2005D1-Q1 is very important for the efficiency of the class-D amplifier, because any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency. For filtering lower-frequency noise signals, a 10-μF, or greater, capacitor placed near the audio power amplifier also helps, but it is not required in most applications because of the high PSRR of this device.

### 10.2.1.3 Application Curve

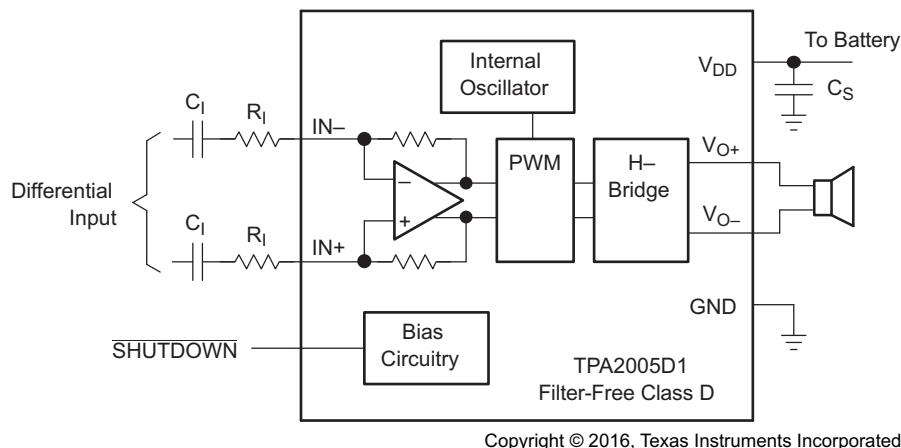

Figure 39. Output Power vs Supply Voltage

### 10.2.2 TPA2005D1-Q1 With Differential Input and Input Capacitors

Copyright © 2016, Texas Instruments Incorporated

Figure 40. TPA2005D1-Q1 Application Schematic With Differential Input And Input Capacitors

#### 10.2.2.1 Detailed Design Requirements

##### 10.2.2.1.1 Input Capacitors (C<sub>1</sub>)

The TPA2005D1-Q1 device does not require input coupling capacitors if the design uses a differential source that is biased from 0.5 V to V<sub>DD</sub> – 0.8 V (shown in Figure 38). If the input signal is not biased within the recommended common-mode input range, if needing to use the input as a high pass filter (shown in Figure 40), or if using a single-ended source (shown in Figure 41), input coupling capacitors are required.

The input capacitors and input resistors form a high-pass filter with the corner frequency, f<sub>c</sub>, determined in Equation 20.

$$f_c = \frac{1}{(2\pi R_1 C_1)} \quad (20)$$

The value of the input capacitor is important to consider, as it directly affects the bass (low frequency) performance of the circuit.

Equation 21 is reconfigured to solve for the input coupling capacitance.

$$C_1 = \frac{1}{(2\pi R_1 f_c)} \quad (21)$$

If the corner frequency is within the audio band, the capacitors should have a tolerance of  $\pm 10\%$  or better, because any mismatch in capacitance causes an impedance mismatch at frequencies lower than the corner frequency.

For a flat low-frequency response, use large input coupling capacitors (1  $\mu\text{F}$ ).

### 10.2.3 TPA2005D1-Q1 With Single-Ended Input

**Figure 41. TPA2005D1-Q1 Application Schematic With Single-Ended Input**

## 11 Power Supply Recommendations

The TPA2005D1-Q1 device is designed to operate from an input voltage supply range between 2.5-V and 5.5-V. Therefore, the output voltage range of power supply should be within this range and well regulated. The current capability of upper power should not exceed the maximum current limit of the power switch.

### 11.1 Power Supply Decoupling Capacitors

The TPA2005D1-Q1 device requires adequate power supply decoupling to ensure a high efficiency operation with low total harmonic distortion (THD). Place a low equivalent-series-resistance (ESR) ceramic capacitor, typically 0.1  $\mu\text{F}$ , within 2 mm of the  $V_{\text{DD}}$  pin. This choice of capacitor and placement helps with higher frequency transients, spikes, or digital hash on the line. In addition to the 0.1  $\mu\text{F}$  ceramic capacitor, TI recommends to place a 2.2- $\mu\text{F}$  to 10- $\mu\text{F}$  capacitor on the  $V_{\text{DD}}$  supply trace. This larger capacitor acts as a charge reservoir, providing energy faster than the board supply, thus helping to prevent any droop in the supply voltage.

## 12 Layout

### 12.1 Layout Guidelines

#### 12.1.1 Component Location

Place all the external components very close to the TPA2005D1-Q1 device. The input resistors need to be very close to the TPA2005D1-Q1 input pins so noise does not couple on the high-impedance nodes between the input resistors and the input amplifier of the TPA2005D1-Q1 device. Placing the decoupling capacitor,  $C_S$ , close to the TPA2005D1-Q1 device is important for the efficiency of the class-D amplifier. Any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency.

#### 12.1.2 Trace Width

Make the high current traces going to pins VDD, GND,  $V_{O+}$  and  $V_{O-}$  of the TPA2005D1-Q1 device have a minimum width of 0.7 mm. If these traces are too thin, the TPA2005D1-Q1 performance and output power will decrease. The input traces do not need to be wide, but do need to run side-by-side to enable common-mode noise cancellation.

#### 12.1.3 8-Pin QFN (DRB) Layout

Use the following land pattern for board layout with the 8-pin QFN (DRB) package. Note that the solder paste should use a hatch pattern to fill solder paste at 50% to ensure that there is not too much solder paste under the package.

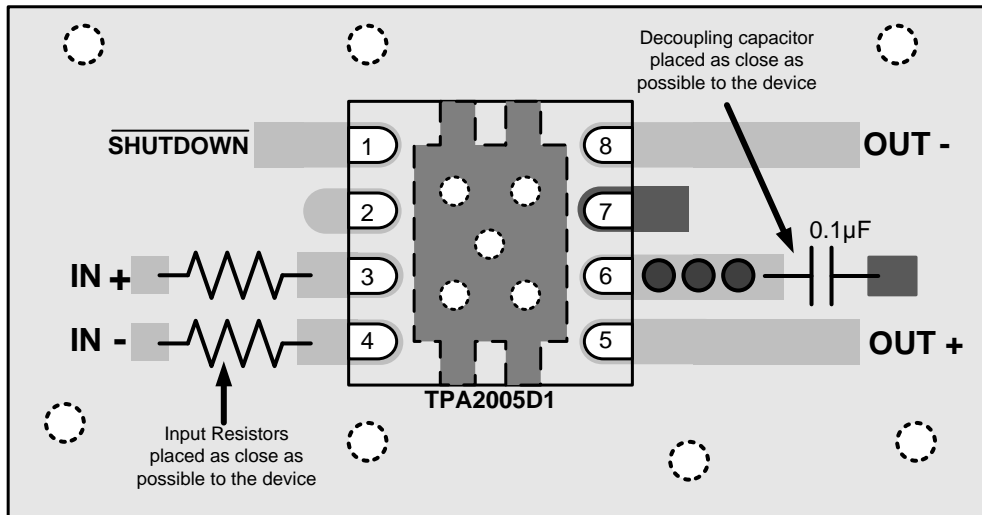

Figure 42. TPA2005D1-Q1 8-Pin QFN (DRB) Board Layout (Top View)

TPA2005D1TDGNRQ1	ACTIVE	MSOP-PowerPAD	DGN	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 105	2005T	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

## THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
