

TPS65053-Q1 5-Channel Power Management IC With Two Step-Down Converters and Three Low-Input Voltage LDOs

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
 - Device Temperature Grade 3: -40°C to $+85^{\circ}\text{C}$ Ambient Operating Temperature Range
 - Device HBM ESD Classification Level 2
 - Device CDM ESD Classification Level C4B
- Up To 95% Efficiency
- Output Current for DC-DC Converters:
 - DCDC1 = 1 A; DCDC2 = 0.6 A
- DC-DC Converters Externally Adjustable
- V_{IN} Range for DC-DC Converters From 2.5 V to 6 V
- 2.25-MHz Fixed Frequency Operation
- Power Save Mode at Light-Load Current
- 180° Out-of-Phase Operation
- Output Voltage Accuracy in PWM Mode $\pm 1\%$
- Total Typical 32- μA Quiescent Current for Both DC-DC Converters
- 100% Duty Cycle for Lowest Dropout
- One General-Purpose 400-mA LDO
- Two General-Purpose 200-mA LDOs
- V_{IN} Range for LDOs from 1.5 V to 6.5 V
- Output Voltage for LDO3:
 - VLDO3 = 1.3 V
- Available in a 4-mm \times 4-mm 24-Pin VQFN Package

2 Applications

- Automotive Li-Ion Battery-Powered Devices
 - GPS, Emergency Cell Phone
 - Digital Cameras
 - Satellite Radio Modules
 - OMAP™ and Low-Power DSP

3 Description

The TPS65053-Q1 device is integrated power management IC (PMIC) for applications powered by one Li-Ion or Li-Polymer cell, which require multiple power rails. The TPS65053-Q1 device provides two highly efficient, 2.25-MHz step-down converters targeted at providing the core voltage and I/O voltage in a processor-based system. Both step-down converters enter a low power mode at light loads for maximum efficiency across the widest possible range of load currents. For low-noise applications, the devices can be forced into fixed-frequency PWM mode by pulling the MODE pin high. Both converters allow the use of small inductors and capacitors to achieve a small solution size.

The TPS65053-Q1 device provides an output current of up to 1 A on the DCDC1 converter and up to 0.6 A on the DCDC2 converter. The device also integrates one 400-mA LDO and two 200-mA LDO voltage regulators, which can be turned on and off using separate enable pins on each LDO. Each LDO operates with an input voltage range from 1.5 V to 6.5 V, allowing them to be supplied from one of the step-down converters or directly from the main battery. LDO1 and LDO2 are externally adjustable, while LDO3 has a fixed output voltage of 1.3 V.

The TPS65053-Q1 device is available in a small 24-pin leadless package (4-mm \times 4-mm VQFN) with a 0,5-mm pitch.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS65053-Q1	VQFN (24)	4.00 mm \times 4.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Original (June 2011) to Revision A	Page
• Added the <i>Device Information</i> table, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section.....	1
• Deleted all references to TPS650531-Q1 and TPS650532-Q1 devices	1
• Changed values in the <i>Thermal Information</i> table to align with JEDEC standards.....	5

5 Pin Configuration and Function

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AGND	24	I	Analog GND, connect to PGND and thermal pad
EN_DCDC1	20	I	Enable Input for converter 1, active high
EN_DCDC2	21	I	Enable Input for converter 2, active high
EN_LDO1	22	I	Enable input for LDO1. Logic high enables the LDO, logic low disables the LDO.
EN_LDO2	11	I	Enable input for LDO2. Logic high enables the LDO, logic low disables the LDO.
EN_LDO3	12	I	Enable input for LDO3. Logic high enables the LDO, logic low disables the LDO.
FB_DCDC1	19	I	Input to adjust output voltage of converter 1 between 0.6 V and V_i . Connect external resistor divider between VOUT1, this pin and GND.
FB_DCDC2	13	I	Input to adjust output voltage of converter 2 between 0.6 V and VIN. Connect external resistor divider between VOUT2, this pin and GND.
FB_LDO1	4	I	Feedback input for the external voltage divider.
FB_LDO2	6	I	Feedback input for the external voltage divider.
L1	17	O	Switch pin of converter 1. Connected to Inductor
L2	15	O	Switch Pin of converter 2. Connected to Inductor.
MODE	23	I	Select between Power Save Mode and forced PWM Mode for DCDC1 and DCDC2. In Power Save Mode, PFM is used at light loads, PWM for higher loads. If PIN is set to high level, forced PWM Mode is selected. If Pin has low level, then the device operates in Power Save Mode.
PGND1	18	I	GND for converter 1
PGND2	14	I	GND for converter 2
RESET	10	O	Open drain active low reset output, 100-ms reset delay time.
THRESHOLD	5	I	Reset input
V_{cc}	1	I	Power supply for digital and analog circuitry of DCDC1, DCDC2 and LDOs. This pin must be connected to the same voltage supply as VINDCDC1/2.
VINDCDC1/2	16	I	Input voltage for VDCDC1 and VDCDC2 step-down converter. This must be connected to the same voltage supply as V_{cc} .

Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
VINLDO1	2	I	Input voltage for LDO1
VINLDO2/3	8	I	Input voltage for LDO2 and LDO3
VLDO1	3	O	Output voltage of LDO1
VLDO2	7	O	Output voltage of LDO2
VLDO3	9	O	Output voltage of LDO3
Thermal Pad		—	Connect to GND

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _I	Input voltage	All pins except AGND, PGND, and EN_LDO1 pins with respect to AGND		V
		–0.3	7	
		–0.3	V _{CC} + 0.5	
V _O	Output voltage for LDO1, LDO2 and LDO3	–0.3	4	V
I _I	Current	VINDCDC1/2, L1, PGND1, L2, PGND2		mA
		All other pins		
			1800	
			1000	
T _A	Operating free-air temperature	–40	85	°C
T _{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	
		±2000	V
		Charged-device model (CDM), per AEC Q100-011	
		All pins	±500
		Corner pins (1, 6, 7, 12, 13, 18, 19, and 24)	±750

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{INDCDC1/2}	Input voltage for step-down converters	2.5		6	V
V _{INLDO1} , V _{INLDO2/3}	Input voltage range for LDOs	1.5		6.5	V
V _{DCDC1}	Output voltage range for externally adjustable VDCDC1 step-down converter	0.6		V _{INDCDC1}	V
V _{DCDC2}	Output voltage range for externally adjustable VDCDC2 step-down converter	0.6		V _{INDCDC2}	V
V _{LDO1-2}	Output voltage range for externally adjustable LDO1 and LDO2	1		3.6	V
V _{LDO3}	Output voltage for LDO3		1.3		V
I _{OUTDCDC1}	Output current at L1			1000	mA
I _{OUTDCDC2}	Output current at L2			600	mA
I _{LDO1}	Output current at VLDO1			400	mA
I _{LDO2,3}	Output current at VLDO2 and VLDO3			200	mA
C _{INDCDC1/2}	Input capacitor at V _{INDCDC1/2} ⁽¹⁾	22			μF
C _{VCC}	Input capacitor at V _{CC} ⁽¹⁾	1			μF
C _{in1-2}	Input capacitor at VINLDO1, VINLDO2/3 ⁽¹⁾	2.2			μF

(1) See the [Application and Implementation](#) section of this data sheet for more details.

Recommended Operating Conditions (continued)

		MIN	NOM	MAX	UNIT
C _{OUTDCDC1}	Output capacitor at V _{DCDC1} ⁽¹⁾	10	22		μF
C _{OUTDCDC2}	Output capacitor at V _{DCDC2} ⁽¹⁾	10	22		μF
C _{OUT1}	Output capacitor at VLDO1 ⁽¹⁾	4.7			μF
C _{OUT2-3}	Output capacitor at VLDO2-3 ⁽¹⁾	2.2			μF
L1	Inductor at L1 ⁽¹⁾	1.5	2.2		μH
L2	Inductor at L2 ⁽¹⁾	1.5	2.2		μH
R _{CC}	Resistor from battery voltage to V _{CC} used for filtering ⁽²⁾		1	10	Ω
T _A	Operating ambient temperature	-40		85	°C
T _J	Operating junction temperature	-40		125	°C

(2) Up to 2 mA can flow into V_{CC} when both converters are running in PWM, this resistor causes the UVLO threshold to be shifted accordingly.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾	TPS65053-Q1	UNIT	
	RGE (VQFN)		
	24 PINS		
R _{θJA}	Junction-to-ambient thermal resistance	31.7	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	23.7	°C/W
R _{θJB}	Junction-to-board thermal resistance	8.0	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.3	°C/W
ψ _{JB}	Junction-to-board characterization parameter	8.0	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	2.2	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

V_{CC} = VINDCDC1/2 = 3.6 V, EN = V_{CC}, MODE = GND, L = 2.2 μH, C_{OUT} = 22 μF, T_A = -40°C to +85°C (unless otherwise noted).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT

7 Detailed Description

7.1 Overview

The TPS65053-Q1 device includes two synchronous step-down converters. The converters operate with 2.25-MHz fixed frequency pulse-width modulation (PWM) at moderate to heavy load currents. At light load currents the converters automatically enter Power Save Mode and operate with PFM (pulse frequency modulation).

During PWM operation the converters use a unique fast response voltage mode controller scheme with input voltage feed-forward to achieve good line and load regulation allowing the use of small ceramic input and output capacitors. At the beginning of each clock cycle initiated by the clock signal, the P-channel MOSFET switch is turned on and the inductor current ramps up until the comparator trips and the control logic turns off the switch. The current limit comparator will also turn off the switch in case the current limit of the P-channel switch is exceeded. After the adaptive dead time prevents shoot-through current, the N-channel MOSFET rectifier is turned on and the inductor current ramps down. The next cycle is initiated by the clock signal again turning off the N-channel rectifier and turning on the P-channel switch.

The two DC-DC converters operate synchronized to each other, with converter 1 as the master. A 180° phase shift between Converter 1 and Converter 2 decreases the input RMS current. Therefore smaller input capacitors can be used.

The converters output voltage is set by an external resistor divider connected to FB_DCDC1 or FB_DCDC2, respectively. See the [Application and Implementation](#) section for more details.

7.3 Feature Description

7.3.1 Mode Selection

The MODE pin allows mode selection between forced PWM Mode and Power Save Mode for both converters. Connecting this pin to GND enables the automatic PWM and Power Save Mode operation. The converters operate in fixed-frequency PWM mode at moderate to heavy loads and in the PFM mode during light loads, maintaining high efficiency over a wide load current range.

Pulling the MODE pin high forces both converters to operate constantly in the PWM mode even at light load currents. The advantage is the converters operate with a fixed frequency that allows simple filtering of the switching frequency for noise sensitive applications. In this mode, the efficiency is lower compared to the Power Save Mode during light loads. For additional flexibility, switch from Power Save Mode to forced PWM mode during operation which allows efficient power management by adjusting the operation of the converter to the specific system requirements.

7.3.2 Enable

The device has a separate enable pin for each of the DC-DC converters and for each of the LDO to start up independently. If EN_DCDC1, EN_DCDC2, EN_LDO1, EN_LDO2, EN_LDO3 are set to high, the corresponding converter starts up with soft start as previously described.

Pulling the enable pin low forces the device into shutdown, with a shutdown quiescent current as defined in the [Electrical Characteristics](#) table. In this mode, the P and N-Channel MOSFETs are turned-off, and the entire internal control circuitry is switched-off. If disabled, the outputs of the LDOs are pulled low by internal 350-Ω resistors, actively discharging the output capacitor. For proper operation the enable pins must be terminated and must not be left unconnected.

7.3.3 Reset

The TPS65053-Q1 device contains circuitry that can generate a reset pulse for a processor with a 100-ms delay time. The input voltage at a comparator is sensed at an input called THRESHOLD. When the voltage exceeds the 1-V threshold, the output goes high after a 100-ms delay time. This circuitry is functional as soon as the supply voltage at V_{CC} exceeds the undervoltage lockout threshold. The RESET circuitry is active even if all DC-DC converters and LDOs are disabled.

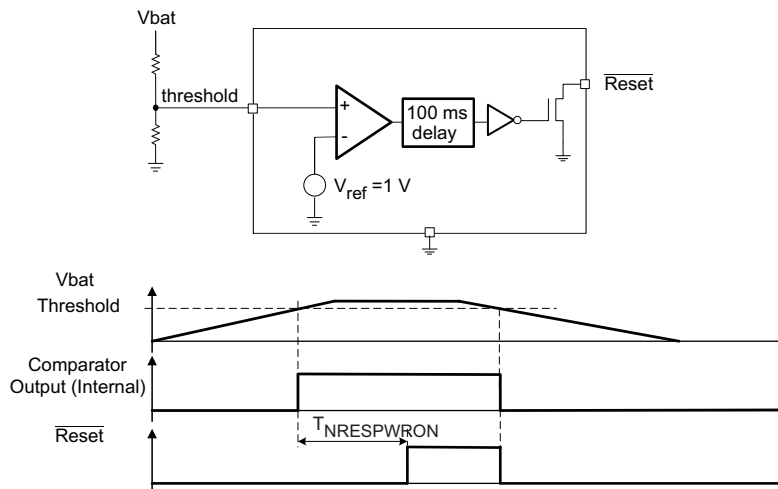

Figure 6. $\overline{\text{RESET}}$ Pulse Circuit

7.3.4 Short-Circuit Protection

All outputs are short circuit protected with a maximum output current as defined in the [Electrical Characteristics](#) table.

Feature Description (continued)

7.3.5 Thermal Shutdown

As soon as the junction temperature, T_j , exceeds 150°C (typical) for the DC-DC converters, the device goes into thermal shutdown. In this mode, the P and N-Channel MOSFETs are turned-off. The device continues operation when the junction temperature falls below the thermal shutdown hysteresis again. A thermal shutdown for one of the DC-DC converters will disable both converters simultaneously.

The thermal shutdown temperature for the LDOs are set to typically 140°C. Therefore an LDO that can be used to power an external voltage will never heat up the chip high enough to turn off the DC-DC converters. If one LDO exceeds the thermal shutdown temperature, all LDOs will turn off simultaneously.

7.3.5.1 Low Dropout Voltage Regulators

The low dropout (LDO) voltage regulators are designed to be stable with low value ceramic input and output capacitors. They operate with input voltages down to 1.5 V. The LDOs offer a maximum dropout voltage of 280 mV at rated output current. Each LDO supports a current limit feature. The LDOs are enabled by the EN_LDO1, EN_LDO2, and EN_LDO3 pin. The output voltage of LDO1 and LDO2 is set using an external resistor divider whereas LDO3 has a fixed output voltage of 1.3 V.

7.4 Device Functional Modes

7.4.1 Power Save Mode

The Power Save Mode is enabled with the MODE pin set to low. If the load current decreases, the converters enter Power Save Mode operation automatically. During Power Save Mode the converters operate with reduced switching frequency in PFM mode and with a minimum quiescent current to maintain high efficiency. The converter positions the output voltage typically 1% above the nominal output voltage. This voltage positioning feature minimizes voltage drops caused by a sudden load step.

To optimize the converter efficiency at light load the average current is monitored and if in PWM mode the inductor current remains below a certain threshold, then Power Save Mode is entered. The typical threshold can be calculated according to [Equation 1](#) and [Equation 2](#).

$$I_{\text{PFM_enter}} = \frac{V_{\text{INDCDC1/2}}}{32 \Omega}$$

where

- $I_{\text{PFM_enter}}$ is the average output current threshold to enter PFM mode. (1)

$$I_{\text{PFM_leave}} = \frac{V_{\text{INDCDC1/2}}}{24 \Omega}$$

where

- $I_{\text{PFM_leave}}$ is the average output current threshold to leave PFM mode. (2)

During the Power Save Mode the output voltage is monitored with a comparator. As the output voltage falls below the skip comparator threshold (skip comp) of $V_{\text{OUTnominal}} + 1\%$, the P-channel switch will turn on and the converter effectively delivers a constant current as defined above. If the load is below the delivered current then the output voltage will rise until the same threshold is crossed again, whereupon all switching activity ceases, hence reducing the quiescent current to a minimum until the output voltage has dropped below the threshold again. If the load current is greater than the delivered current then the output voltage will fall until it crosses the skip comparator low (Skip Comp Low) threshold set to 1% below nominal V_{OUT} , whereupon Power Save Mode is exited and the converter returns to PWM mode.

These control methods reduce the quiescent current typically to 12 μA per converter and the switching frequency to a minimum thereby achieving the highest converter efficiency. The PFM mode operates with very low output voltage ripple. The ripple depends on the comparator delay and the size of the output capacitor; increasing capacitor values will make the output ripple tend to zero.

The Power Save Mode can be disabled by driving the MODE pin high. Both converters will operate in fixed PWM mode. Power Save Mode Enable/Disable applies to both converters.

Device Functional Modes (continued)

7.4.1.1 Dynamic Voltage Positioning

This feature reduces the voltage undershoot and overshoot at load steps from light to heavy load and vice versa. It is activated in Power Save Mode operation when the converter runs in PFM Mode. It provides more headroom for both the voltage drop at a load step increase and the voltage increase at a load throw-off which improves load transient behavior.

At light loads, in which the converters operate in PFM Mode, the output voltage is regulated typically 1% higher than the nominal value. In case of a load transient from light load to heavy load, the output voltage will drop until it reaches the skip comparator low threshold set to -1% below the nominal value and enters PWM mode. During a load throw off from heavy load to light load, the voltage overshoot is also minimized due to active regulation turning on the N-channel switch.

Figure 7. Dynamic Voltage Positioning

7.4.1.2 Soft Start

The two converters have an internal soft start circuit that limits the inrush current during start-up. During soft start, the output voltage ramp up is controlled as shown in Figure 8.

Figure 8. Soft Start

Device Functional Modes (continued)

7.4.1.3 100% Duty-Cycle Low Dropout Operation

The converters offer a low input to output voltage difference while still maintaining operation with the use of the 100% duty cycle mode. In this mode the P-channel switch is constantly turned on. This is particularly useful in battery-powered applications to achieve longest operation time by taking full advantage of the whole battery voltage range; essentially the minimum input voltage to maintain regulation depends on the load current and output voltage and can be calculated as shown in [Equation 3](#).

$$V_{INmin} = V_{OUTmax} + I_{OUTmax} \times (R_{DSon_{max}} + R_L)$$

where

- I_{OUTmax} = maximum output current plus inductor ripple current
- $R_{DSon_{max}}$ = maximum P-channel switch $r_{DS(on)}$
- R_L = DC resistance of the inductor
- V_{OUTmax} = nominal output voltage plus maximum output voltage tolerance (3)

With decreasing load current, the device automatically switches into pulse skipping operation in which the power stage operates intermittently based on load demand. By running cycles periodically the switching losses are minimized and the device runs with a minimum quiescent current maintaining high efficiency.

In Power Save Mode the converter only operates when the output voltage trips below its nominal output voltage. It ramps up the output voltage with several pulses and goes again into Power Save Mode when the output voltage exceeds the nominal output voltage.

7.4.1.4 Undervoltage Lockout

The undervoltage lockout circuit prevents the device from malfunctioning by disabling the converter at low input voltages and from excessive discharge of the battery. The undervoltage lockout threshold is 1.8 V (typical) and 2 V (maximum).

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS65053-Q1 PMIC integrates two step-down converters and three LDOs which can be used to power the voltage rails needed by a processor or another application. The PMIC can be controlled via the ENABLE and MODE pins or sequenced from the VIN using RC delay circuits. There is a logic output, RESET, to provide the application processor or load a logic signal indicating power good or reset.

8.2 Typical Application

Figure 9. Typical Application Circuit

Typical Application (continued)

8.2.1 Design Requirements

Table 1 lists the design parameters for this application example.

Table 1. Power Design Requirements

PARAMETER	VALUE
Buck 1 and 2 Input voltage, $V_{INDCDC1/2}$	2.9 to 6 V (labeled V_{bat} in Figure 9)
Buck 1 Output voltage, V_{DCDC1}	2.85 V (see Table 2 for FB_DCDC1 resistor divider selection)
Buck 1 Output current, $I_{OUTDCDC1}$	1 A
Buck 2 Output voltage, V_{DCDC2}	1.8 V (see Table 2 for FB_DCDC2 resistor divider selection)
Buck 2 Output current, $I_{OUTDCDC2}$	600 mA
Linear Regulator 1 Input voltage, V_{INLDO1}	2.85 V (from V_{DCDC1} , as shown in Figure 9)
Linear Regulator 1 Output voltage, V_{LDO1}	1.6 V (see Table 5 for FB_LDO1 resistor divider selection)
Linear Regulator 1 Output current, I_{LDO1}	400 mA
Linear Regulator 2 and 3 Input voltage, $V_{INLDO2/3}$	2.9 to 6 V (labeled V_{bat} in Figure 9)
Linear Regulator 2 Output voltage, V_{LDO2}	3.3 V (see Table 5 for FB_LDO2 resistor divider selection)
Linear Regulator 2 Output current, I_{LDO2}	200 mA
Linear Regulator 3 Output voltage, V_{LDO3}	1.3 V (fixed)
Linear Regulator 3 Output current, I_{LDO3}	200 mA

8.2.2 Detailed Design Procedure

8.2.2.1 Output Voltage Setting

Use Equation 4 to calculate the output voltage of the DC-DC converters, with an internal reference voltage V_{ref} , 0.6 V (typical). This voltage can be set by an external resistor network.

$$V_{OUT} = V_{ref} \times \left(1 + \frac{R1}{R2} \right) \tag{4}$$

TI recommends setting the total resistance of $R1 + R2$ to less than 1 M Ω . The resistor network connects to the input of the feedback amplifier; therefore, requiring some small feed-forward capacitor in parallel to $R1$. A typical value of 47 pF is sufficient.

$$R1 = R2 \times \left(\frac{V_{OUT}}{V_{(FB_DCDC1)}} \right) - R2 \tag{5}$$

Table 2. Typical DC-DC Feedback Resistor Values

OUTPUT VOLTAGE	R1	R2	NOMINAL VOLTAGE	TYPICAL Cff
3.3 V	680 k Ω	150 k Ω	3.32 V	47 pF
3 V	510 k Ω	130 k Ω	2.95 V	47 pF
2.85 V	560 k Ω	150 k Ω	2.84 V	47 pF
2.5 V	510 k Ω	160 k Ω	2.51 V	47 pF
1.8 V	300 k Ω	150 k Ω	1.8 V	47 pF
1.6 V	200 k Ω	120 k Ω	1.6 V	47 pF
1.5 V	300 k Ω	200 k Ω	1.5 V	47 pF
1.2 V	330 k Ω	330 k Ω	1.2 V	47 pF

8.2.2.2 Output Filter Design (Inductor and Output Capacitor)

8.2.2.2.1 Inductor Selection

The two converters operate typically with a 2.2- μH output inductor. Larger or smaller inductor values can be used to optimize the performance of the device for specific operation conditions. For output voltages higher than 2.8 V, an inductor value of 3.3 μH minimum should be selected, otherwise the inductor current will ramp down too fast causing imprecise internal current measurement and therefore increased output voltage ripple under some operating conditions in PFM mode.

The selected inductor must be rated for its DC resistance and saturation current. The DC resistance of the inductance will influence directly the efficiency of the converter. Therefore an inductor with lowest DC resistance should be selected for highest efficiency.

Use Equation 6 to calculate the maximum inductor current under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current as calculated with Equation 6. This is recommended because during heavy load transient the inductor current will rise above the calculated value.

$$\Delta I_L = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f} \quad I_{Lmax} = I_{OUTmax} + \frac{\Delta I_L}{2}$$

where

- f = Switching Frequency (2.25-MHz typical)
- L = Inductor Value
- ΔI_L = Peak-to-peak inductor ripple current
- I_{Lmax} = Maximum Inductor current

(6)

The highest inductor current occurs at the maximum V_{IN} . Open core inductors have a soft saturation characteristic, and they can normally handle higher inductor currents versus a comparable shielded inductor.

A more conservative approach is to select the inductor current rating just for the maximum switch current of the corresponding converter. The fact that the core material from inductor to inductor differs and will have an impact on the efficiency especially at high switching frequencies must be considered. Refer to Table 3 and the typical applications for possible inductors.

Table 3. Tested Inductors

INDUCTOR TYPE	INDUCTOR VALUE	SUPPLIER
LPS3010	2.2 μH	Coilcraft
LPS3015	3.3 μH	Coilcraft
LPS4012	2.2 μH	Coilcraft
VLF4012	2.2 μH	TDK

8.2.2.2.2 Output Capacitor Selection

The advanced Fast Response voltage mode control scheme of the two converters allow the use of small ceramic capacitors with a typical value of 10 μF , without having large output voltage under and overshoots during heavy load transients. Ceramic capacitors having low ESR values result in lowest output voltage ripple and are therefore recommended. See the recommended components in Table 5.

If ceramic output capacitors are used, the capacitor RMS ripple current rating will always meet the application requirements. Use Equation 7 to calculate the rms ripple current.

$$I_{RMSout} = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f} \times \frac{1}{2 \times \sqrt{3}}$$

(7)

At nominal load current, the inductive converters operate in PWM mode and the overall output voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor as shown in Equation 8.

$$\Delta V_{OUT} = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f} \times \left(\frac{1}{8 \times C_{OUT} \times f} + ESR \right) \quad (8)$$

Where the highest output voltage ripple occurs at the highest input voltage, V_{IN} .

At light load currents, the converters operate in Power Save Mode and the output voltage ripple is dependent on the output capacitor value. The output voltage ripple is set by the internal comparator delay and the external capacitor. The typical output voltage ripple is less than 1% of the nominal output voltage.

8.2.2.2.3 Input Capacitor Selection

Because of the nature of the buck converter, having a pulsating input current, a low ESR input capacitor is required for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes. The converters need a ceramic input capacitor of 10 μ F. The input capacitor can be increased without any limit for better input voltage filtering.

Table 4. Possible Capacitors for DC-DC Converters and LDOs

CAPACITOR VALUE	SIZE	SUPPLIER	TYPE
2.2 μ F	0805	TDK C2012X5R0J226MT	Ceramic
2.2 μ F	0805	Taiyo Yuden JMK212BJ226MG	Ceramic
10 μ F	0805	Taiyo Yuden JMK212BJ106M	Ceramic
10 μ F	0805	TDK C2012X5R0J106M	Ceramic

8.2.2.3 Low Dropout Voltage Regulators (LDOs)

The output voltage of LDO1 and LDO2 can be set by an external resistor network and can be calculated as shown in [Equation 9](#) with an internal reference voltage, V_{ref} , typical 1 V.

$$V_{OUT} = V_{ref} \times \left(1 + \frac{R5}{R6} \right) \quad (9)$$

TI recommends setting the total resistance of $R5 + R6$ to less than 1 M Ω . Typically, no feedforward capacitor is required at the voltage dividers for the LDOs.

$$V_{OUT} = V_{(FB)} \times \frac{R5 + R6}{R6} \quad R5 = R6 \times \left(\frac{V_{OUT}}{V_{(FB)}} \right) - R6 \quad (10)$$

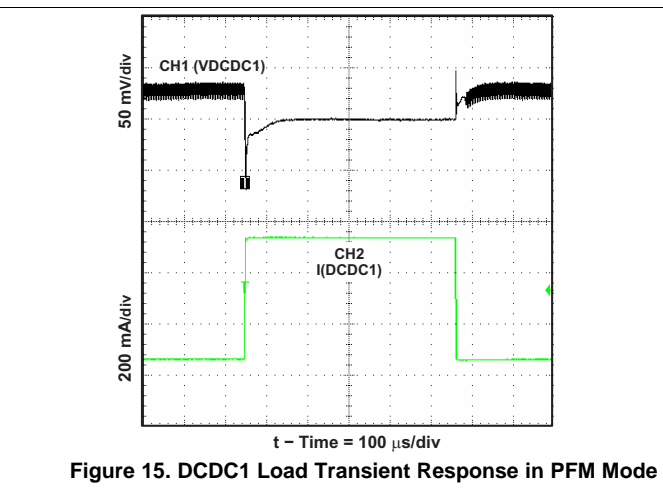

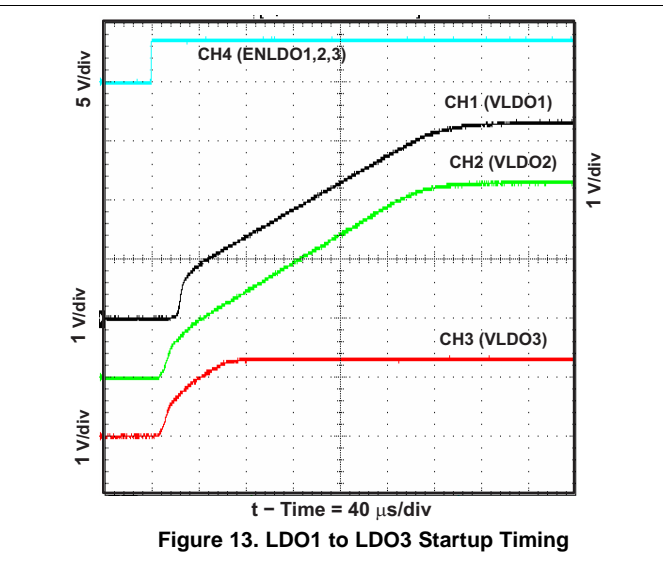

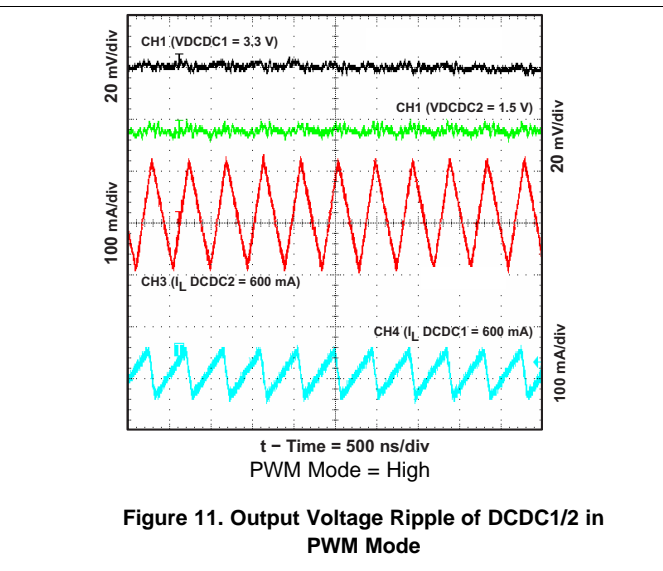

Table 5. Typical LDO Feedback Resistor Values

OUTPUT VOLTAGE	R5	R6	NOMINAL VOLTAGE
3.3 V	300 k Ω	130 k Ω	3.31 V
3 V	300 k Ω	150 k Ω	3 V
2.85 V	240 k Ω	130 k Ω	2.85 V
2.8 V	360 k Ω	200 k Ω	2.8 V
2.5 V	300 k Ω	200 k Ω	2.5 V
1.8 V	240 k Ω	300 k Ω	1.8 V
1.5 V	150 k Ω	300 k Ω	1.5 V
1.3 V	36 k Ω	120 k Ω	1.3 V
1.2 V	100 k Ω	510 k Ω	1.19 V
1.1 V	33 k Ω	330 k Ω	1.1 V

8.2.2.3.1 Input Capacitor and Output Capacitor Selection for the LDOs

The minimum input capacitor on V_{IN_LDO1} and on $V_{IN_LDO2/3}$ is 2.2 μ F minimum. LDO1 is designed to be stable with an output capacitor of 4.7 μ F minimum; whereas, LDO2 and LDO3 are stable with a minimum capacitor value of 2.2 μ F.

9 Power Supply Recommendations

The TPS65053-Q1 has only a few power supply recommendations in addition to adhering to the minimum and maximum values in the [Recommended Operating Conditions](#). The following check list provides power supply recommendations that should be used in conjunction with complying to the Recommended Operating Conditions of the device.

- 1- μ F Bypass cap on VCC, located as close as possible to the VCC pin to ground.
- VCC and VINDCDC1/2 must be connected to the same voltage supply with minimal voltage difference.
- Input capacitors must be present on the VINDCDC1/2, VIN_LDO1, and VIN_LDO2/3 supplies if used.
- Output filters must be used on the outputs of the DCDC converters if used.
- Output capacitors must be used on the outputs of the LDOs if used.

10 Layout

10.1 Layout Guidelines

The following check list provides layout guidelines that have been followed in the [Layout Example](#) shown in [Figure 23](#).

- The input capacitors for the DC-DC converters should be placed as close as possible to the VINDCDC1/2 pin and the PGND1 and PGND2 pins.
- The inductor of the output filter should be placed as close as possible to the device to provide the shortest switch node possible, reducing the noise emitted into the system and increasing the efficiency.
- Sense the feedback voltage from the output at the output capacitors to ensure the best DC accuracy. Feedback should be routed away from noisy sources such as the inductor. If possible route on the opposing side as the switch node and inductor and place a GND plane between the feedback and the noisy sources or keep-out underneath them entirely.
- Place the output capacitors as close as possible to the inductor to reduce the feedback loop as much as possible. This will ensure best regulation at the feedback point.
- Place the device as close as possible to the most demanding or sensitive load. The output capacitors should be placed close to the input of the load. This will ensure the best AC performance possible.
- The input and output capacitors for the LDOs should be placed close to the device for best regulation performance.
- The use a one common ground plane is recommended for the device layout. The AGND can be separated from the PGND, but a large low parasitic PGND is required to connect the PGND1/2 pins to the CIN and external PGND connections.

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.7 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65053IRGERQ1	ACTIVE	VQFN	RGE	24	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	TPS 65053Q	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
