## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (March 2014) to Revision F	Page
• Changed the word <i>terminal</i> back to <i>pin</i> throughout the document .....	3
• Changed the MIN, TYP, and MAX values for the 1.2VSENSE output voltage in the <i>Electrical Characteristics</i> table .....	6
• Changed the y-axis intervals for the 1.2VSENSE vs <i>Temperature</i> graph.....	9

Changes from Revision D (August 2013) to Revision E	Page
• Added the <i>Device Information</i> table and the following new sections: <i>Power Supply Recommendations</i> , <i>Device and Documentation Support</i> , and <i>Mechanical, Packaging, and Orderable Information</i> .....	1
• Changed the word <i>pin</i> to <i>terminal</i> throughout the document .....	3
• Moved the <i>Pin Functions</i> section into the <i>Pin Configuration and Functions</i> section.....	3
• Changed DC CHARACTERISTICS condition statement from T <sub>J</sub> = –40°C to 150°C to T <sub>J-Max</sub> = 150°C .....	5
• Changed min value for V <sub>IL</sub> of IGN_EN from 2 to 2.2 in the DC CHARACTERISTICS table.....	5
• Moved all timing requirements out of the <i>Electrical Characteristics</i> table and into the <i>Timing Requirements</i> table .....	7
• Combined the general application equations with the practical equations to streamline the <i>Typical Application</i> section .....	18
• Changed Y-axis name from <i>Current (mA)</i> to <i>Efficiency</i> in <a href="#">Figure 17</a> .....	25
• Moved the <i>Efficiency vs Output Current on VREG</i> graph and the scope plots from the <i>Typical Characteristics</i> section to the <i>Application Curves</i> section .....	25

Changes from Revision C (April 2013) to Revision D	Page
• Changed V <sub>IH</sub> max limit from 4 to 3.6 V in DC Characteristics table .....	5
• Added 3.7 V condition and values to Input High I <sub>IH</sub> parameter in DC Characteristics table .....	5
• Changed I <sub>Charge</sub> unit from V to μA in DC Characteristics table .....	6
• Changed internal resistor limit text in <i>Ignition Enable Input, IGN_EN</i> pin description .....	11

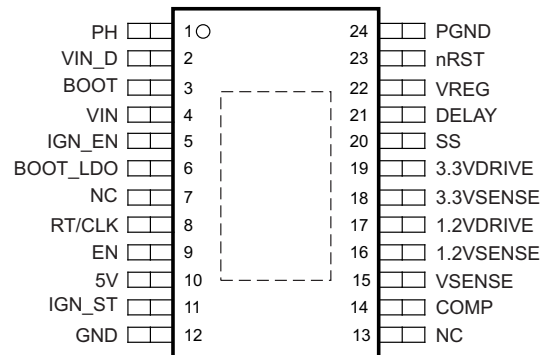

## 5 Pin Configuration and Functions

**RHF Package**

### Pin Functions

NAME	PIN		I/O	DESCRIPTION
	PWP	RHF		
1.2VDRIVE	17	15	O	Output current source to drive the base of an external bipolar transistor to regulate the 1.234-V supply
1.2VSENSE	16	14	I	Voltage node of 1.234-V supply
3.3VDRIVE	19	17	O	Output current source to drive the base of an external bipolar transistor to regulate the 3.3-V supply
3.3VSENSE	18	16	I	Voltage node of 3.3-V supply
5V	10	8	O	External capacitor to ground for stability of regulated output
BOOT	3	1	O	External bootstrap capacitor connected to PH (pin 1) to drive gate of internal switching FET
BOOT_LDO	6	4	O	External capacitor connected to ground for stability of internal regulator
COMP	14	12	O	Error amplifier output to connect external compensation components
DELAY	21	19	O	External capacitor to ground to program the power-on-reset delay
EN	9	7	I	A high logic-level input signal to enable and low signal to disable device. Internally pulled down to ground
GND	12	10	O	Ground pin, must be electrically connected to exposed pad on PCB for proper thermal performance
IGN_EN	5	3	I	Ignition input (high-voltage tolerant) internally pulls to ground. Must be externally pulled up to enable
IGN_ST	11	9	O	Active-low, open-drain ignition input indicator, output connected to external bias voltage through a resistor. Asserted high after ignition input is high
NC	7	5	—	Connect to ground
	13	11		
nRST	23	21	O	Active-low, open-drain reset output connected to external bias voltage through a resistor. This output is asserted high after the preregulator, 3.3-V, and 1.234-V regulator outputs are regulating and the delay timer has expired. Also, output is asserted low if any one of these three supplies is out of the set regulation, this threshold is internally set.
PGND	24	22	O	Power ground pin, must be electrically connected to exposed pad on PCB for proper thermal performance
PH	1	23	O	Source of internal switching FET
RT/CLK	8	6	I/O	External resistor connected ground to program the internal oscillator. Alternative option is to feed an external clock to provide reference for switching frequency.
SS	20	18	O	External capacitor to ground to program soft-start time
VIN	4	2	I	Unregulated input voltage supply. Pins 2 and 4 must be connected together externally.
VIN_D	2	24	I	Drain input for internal high-side MOSFET. Pins 2 and 4 must be connected together externally.
VREG	22	20	I	Buck converter output. Integrated internal low-side FET to load output during startup or limit voltage overshoot
VSENSE	15	13	I	Inverting node of error amplifier for voltage-mode control of preregulated supply
Thermal pad			—	Electrically connect to ground and solder to ground plane of PCB for thermal efficiency

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Buck regulator	VIN, VIN_D	-0.3	45	V
	BOOT	-0.3	50	V
	PH	-1 -2 for 30 ns	45	V
	VSENSE	-0.3	5.5	V
Control	IGN_EN	-0.3	45	V
	EN, 3.3VSENSE, 1.2VSENSE, RT/CLK, VREG	-0.3	5.5	V
Output	3.3VDRIVE, 1.2VDRIVE	-0.3	8	V
	nRST, IGN_ST	-0.3	5.5	V
	DELAY, COMP	-0.3	7	V
	BOOT_LDO, 5V	-0.3	9	V
Operating junction temperature, T <sub>J</sub>		-40	150	°C
Storage temperature, T <sub>stg</sub> Moved the storage temperature and ESD ratings out of the <i>Absolute Maximum Ratings</i> table and into the new <i>Handling Ratings</i> table		-55	165	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT	
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2000	V	
		Charged-device model (CDM), per AEC Q100-011	All pins		±500
			Corner pins (1, 12, 13, and 24)		±750

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
VIN, VIN_D	5.6		40	V
BOOT	5.6		48	V
PH	-1		40	V
IGN_EN	0		40	V
EN, VSENSE, 3.3VSENSE, 1.2VSENSE, RT/CLK, nRST, IGN_ST	0		5.25	V
VREG, 3.3VDRIVE, 1.2VDRIVE	0		7.5	V
SS, DELAY, COMP	0		6.5	V
BOOT_LDO	0		8.1	V
Operating ambient temperature range, T <sub>A</sub>	-40		125	°C

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS65300-Q1		UNIT
		PWP (HTSSOP)	RHF (VQFN)	
		24 PINS	24 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	33.6	30.3	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	16.6	30.5	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	14.5	8.7	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.4	0.3	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	14.3	8.8	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	1.3	1.6	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 DC Characteristics

V<sub>IN</sub> = 6 V to 27 V, I<sub>GN\_EN</sub> = V<sub>IN</sub>, T<sub>J-Max</sub> = 150°C, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>VIN, VIN_D (Input Power Supply)</b>						
V <sub>IN</sub> , VIN_D	Supply voltage on VIN, line	Normal mode, after initial start-up	5.6	14	40	V
I <sub>Q-Normal</sub>	Current normal mode	Open-loop test		4.57		mA
I <sub>SD VIN</sub>	Shut down	IGN = 0 V, V <sub>IN</sub> = 12 V, T <sub>A</sub> = -40°C to 125°C		2.2	15	μA
I <sub>SD VIND</sub>		IGN = 0 V, V <sub>IN</sub> = 12 V, T <sub>A</sub> = -40°C to 125°C		2.2	15	
<b>IGN_EN (Ignition Input)</b>						
V <sub>IGN_EN</sub>	Input voltage range	Input into IGN_EN pin		14	40	V
V <sub>IH</sub>	Input high	Enable device to be ON (rising signal)		3.16	3.6	V
V <sub>IL</sub>	Input low	Enable device to be OFF (falling signal)	2.2	3.03		V
I <sub>IH</sub>	Input high	Enable device to be ON, V <sub>IGN_EN</sub> = 18 V		23.7	50	μA
		Enable device to be ON, V <sub>IGN_EN</sub> = 3.7 V		4	7	
<b>EN (Logic Level Enable)</b>						
V <sub>IH</sub>	Input high	Enable device to be ON (rising signal)		1.7	2.3	V
V <sub>IL</sub>	Input low	Enable device to be OFF (falling signal)	0.7	1.53		V
<b>Switch-Mode Output 5.3 V</b>						
V <sub>REG</sub>	Regulator output internal resistor network	Fixed output based on internal resistor network	5.178	5.3	5.542	V
C <sub>O</sub>	Output capacitor for 5.3 V	ESR = 0.001 Ω to 100 mΩ; large output capacitance may be required for load transients		10		μF
r <sub>ds(on)</sub>	Internal switch resistance	Measured across VIN_D and PH pins, I <sub>VREG</sub> = 1 A		0.3		Ω
I <sub>O-CL</sub>	Switch current-limit	V <sub>IN</sub> = 12 V	1.2	2	3	A
<b>VSENSE (Internal Reference Voltage)</b>						
V <sub>REG ref</sub>	Internal reference voltage		1.954	2	2.046	V
<b>SS (Soft-Start Timer for Switch-Mode Converter)</b>						
I <sub>SS</sub>	Soft-start source current	C <sub>SS</sub> = 0.001 μF to 0.01 μF	40	50	60	μA
<b>IGN_ST (Ignition Input Status)</b>						
V <sub>OL</sub>	Output low	Output asserted low when I <sub>GN_EN</sub> < 2.2 V, I <sub>OL</sub> = 1 mA		0.056	0.4	V
I <sub>IH</sub>	Leakage test	I <sub>GN_ST</sub> = 5 V		0.05	2	μA
<b>5V (5-V Linear Regulator)</b>						
V <sub>Vo</sub>	Output voltage	I <sub>O</sub> = 1 mA, V <sub>REG</sub> = 5.3 V	4.9	5	5.1	V
ΔV <sub>O-Line</sub>	Line regulation	5.15 V < V <sub>REG</sub> < 5.45 V, I <sub>O</sub> = 1 mA, V <sub>IN</sub> = 12 V		10	20	mV

**DC Characteristics (continued)**

 VIN = 6 V to 27 V, IGN\_EN = VIN, T<sub>J-Max</sub> = 150°C, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$\Delta V_{O-Load}$	Load regulation	1 mA < I <sub>O</sub> < 200 mA, VREG = 5.3 V, VIN = 12 V		10	30	mV
V <sub>DO</sub>	Dropout voltage	I <sub>O</sub> = 150 mA, measure VREG when V <sub>O</sub> (nom) – 0.1 V, then V <sub>DO</sub> = VREG – (5V <sub>O</sub> – 0.1) V, VREG > 5 V		0.15	0.26	V
I <sub>5V-CL</sub>	Current-limit	5V <sub>O</sub> = 0.8 × 5V <sub>O</sub> (nominal)	350	1080		mA
C <sub>O</sub>	Output capacitor	ESR = 0.001 Ω to 2 Ω. Larger output capacitance may be required for load transients.	1	2.2	10	μF
PSRR	Power-supply rejection ratio	f = 100 Hz, VREG = 5.3 V, I <sub>O</sub> = 100 mA, VIN = 12 V	45	60	75	dB
<b>3.3-V Linear Regulator Controller (3.3VSENSE)</b>						
3.3V <sub>O</sub>	Output voltage	I <sub>O</sub> = 5 mA, V <sub>nnpn_power</sub> input = 5.3 V	3.234	3.3	3.366	V
$\Delta 3.3V_{O-Line}$	Line regulation	3.8 V < V <sub>nnpn_power</sub> input < 7 V (with nRST not triggered)		1	10	mV
$\Delta 3.3V_{O-Load}$	Load regulation	5 mA < I <sub>O</sub> < 550 mA		7.5	30	mV
C <sub>O</sub>	Output capacitor for 3.3 V	ESR = 0.001 Ω to 2 Ω. Large output capacitance may be required for load transients.	1	4.7	10	μF
PSRR	Power-supply rejection ratio	f = 100 Hz, VREG = 5.3 V, I <sub>O</sub> = 200 mA, VIN = 12 V	45	60	75	dB
<b>3.3VDRIVE (Ex. Switch Control Output)</b>						
I <sub>OH</sub>	Base drive current. NPN turn ON	3.3VDRIVE – 3.3VSENSE = 1 V	10	28	50	mA
I <sub>OL</sub>	NPN turn off	3.3VDRIVE – 3.3VSENSE at 0.2V	0.1	0.412		mA
<b>1.2-V Linear Regulator Controller (1.2VSENSE)</b>						
1.2V <sub>O</sub>	Output voltage	I <sub>O</sub> = 5 mA, V <sub>nnpn_power</sub> input = 5.3 V	1.209	1.234	1.259	V
$\Delta 1.2V_{O-Line}$	Line regulation	3.25 V < V <sub>nnpn_power</sub> input < 7 V (with nRST not triggered)		1	10	mV
$\Delta 1.2V_{O-Load}$	Load regulation	5 mA < I <sub>O</sub> < 350 mA		5	15	mV
C <sub>O</sub>	Output capacitor for 1.2 V	ESR = 0.001 Ω to 100 mΩ. Large output capacitance may be required for load transients.	8	10	12	μF
PSRR	Power-supply rejection ratio	f = 100 Hz, VREG = 6 V, I <sub>O</sub> = 200 mA, VIN = 12 V	45	60	75	dB
<b>1.2VDRIVE (Ex. Switch Control Output)</b>						
I <sub>OH</sub>	Base drive current. NPN turn ON	1.2VDRIVE – 1.2VSENSE = 1 V	10	27	50	mA
I <sub>OL</sub>	NPN turn off	1.2VDRIVE – 1.2VSENSE at 0.2 V	0.1	0.47		mA
<b>DELAY (Power-On-Reset Delay)</b>						
V <sub>Threshold</sub>	Threshold voltage	Threshold to release nRST high	1.3	2.05	2.6	V
I <sub>Charge</sub>	Capacitor charging current		1.4	2	2.6	μA
<b>nRST (Reset Indicator)</b>						
V <sub>OL</sub>	Output low	Reset asserted due to falling VREG or 3.3V <sub>O</sub> or 1.2V <sub>O</sub> output voltages, I <sub>OL</sub> = 1 mA	0	0.16	0.4	V
V <sub>TH_VREG</sub>	Trigger nRST for VREG output	VREG ramp down	0.87	0.9	0.93	VREG
	Trigger nRST for 3.3V <sub>O</sub>		0.9	0.93	0.96	3.3 V <sub>O</sub>
	Trigger nRST for 1.2V <sub>O</sub>		0.9	0.93	0.96	1.2 V <sub>O</sub>
I <sub>IH</sub>	Leakage test	Reset = 5 V		0.07	2	μA
<b>RT/CLK (Oscillator Setting of External Clock Input)</b>						
V <sub>IH</sub>	Input high				2.3	V
V <sub>IL</sub>	Input low		0.6			V

## 6.6 Timing Requirements

		MIN	NOM	MAX	UNIT
<b>Switch-Mode Output 5.3 V</b>					
$t_{ON-min}$	Minimum ON time		40		ns
$D_{max}$	Maximum duty cycle		97%		

## 6.7 Switching Characteristics

$V_{IN} = 6\text{ V to }27\text{ V}$ ,  $IGN\_EN = V_{IN}$ ,  $T_{J-Max} = 150^{\circ}\text{C}$ , unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
<b>5V (5-V Linear Regulator)</b>							
$V_{soft-start}$	Soft start on enable cycle	$5V_O = 0\text{ V}$ (initially) with fsw = 2.5 MHz		13		ms	
<b>3.3-V Linear Regulator Controller (3.3VSENSE)</b>							
$t_{ss}$	Soft-start time	$3.3V_O = 0\text{ V}$ (initially) with fsw = 2.5 MHz		12.3		ms	
<b>1.2-V Linear Regulator Controller (1.2VSENSE)</b>							
$t_{ss}$	Soft-start time	$1.2V_O = 0\text{ V}$ (initially) with fsw = 2.5 MHz		8.5		ms	
<b>nRST (Reset Indicator)</b>							
$t_{nRSTdy}$	Filter time	Delay before nRST is asserted low		11		$\mu\text{s}$	
<b>RT/CLK (Oscillator Setting of External Clock Input)</b>							
fsw	Switching freq using RT mode		2		3	MHz	
	Switching freq using CLK mode		2		3	MHz	
	Minimum clock input pulse duration			40		ns	
	Internal oscillator frequency		Switching frequency tolerance for clock	-14%		14%	
	External clock input		Switching frequency tolerance for clock	-20%		10%	

### 6.8 Typical Characteristics

### 6.9 5-V Linear Regulator ( $5V_O$ )

### 6.10 3.3-V Linear Regulator Controller (3.3V<sub>O</sub>)

### 6.11 1.234-V Linear Regulator Controller (1.2V<sub>O</sub>)

## 7 Detailed Description

### 7.1 Overview

The device integrates an asynchronous switch-mode power-supply converter with a internal FET that converts the input battery voltage to a 5.3-V pre-regulator output. This 5.3-V output supplies the other regulators. The frequency range is from 2 MHz to 3 MHz, allowing the use of low-profile inductors and low value input and output capacitors. External loop compensation provides flexibility which optimizes the converter response for the appropriate operating condition.

A fixed 5-V linear regulator with an internal FET is integrated as an external peripheral supply. A fixed 3.3-V linear regulator controller with external bi-polar transistor is used for an IO supply, for example. A fixed 1.234-V linear regulator controller with external bi-polar transistor is used for a CPU Core supply, for example. The device has a voltage supervisor which monitors the output of the switch-mode power supply, the 3.3-V linear regulator, and the 1.234-V linear regulator.

An external timing capacitor sets the power-on delay and the release of the reset output nRST. This reset output is also used to indicate if the switch-mode supply, the 3.3-V linear regulator supply, or the 1.234-V linear regulator supply is outside the set limits. The 5-V regulator tracks the 3.3-V linear regulator within the specified limits.

### 7.2 Functional Block Diagram

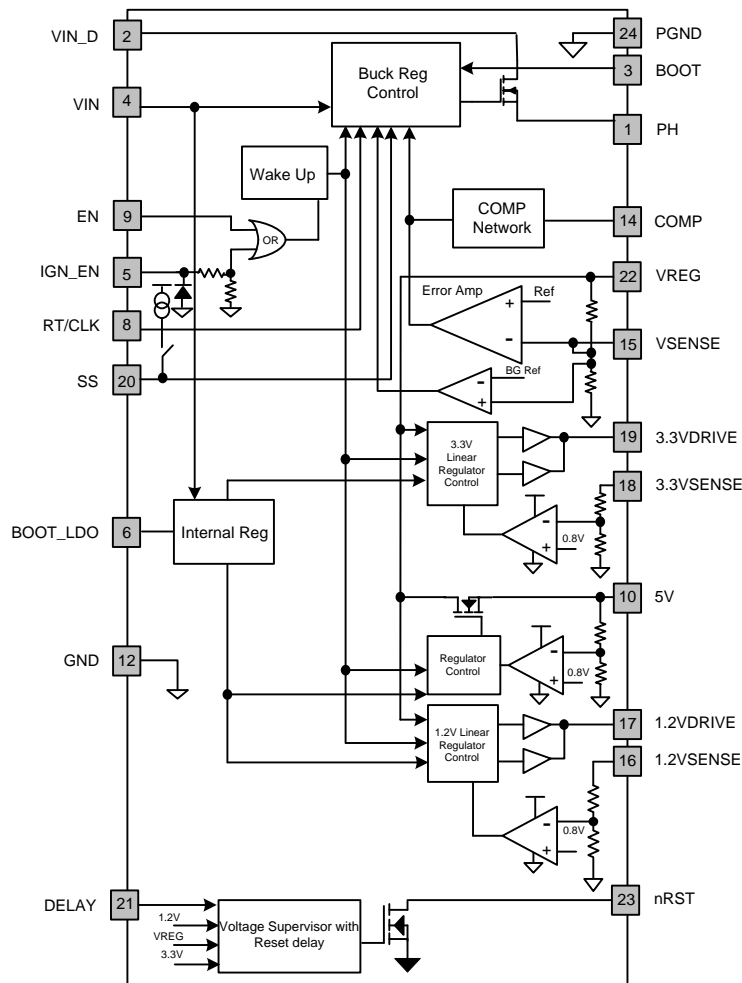

Figure 11. Internal Functional Blocks

## 7.3 Feature Description

### 7.3.1 Detailed Pin Descriptions

**Buck Supply, VIN\_D** The buck supply is an input power source for the internal high-side MOSFET of the switch-mode power supply.

**Phase Node for Buck Regulator, PH** This pin provides the floating voltage reference for the internal drive circuitry.

**Bootstrap, BOOT** The ceramic capacitor on this pin acts as a voltage supply for the internal high-side MOSFET gate-drive circuitry. The capacitor connects between the BOOT and PH pins. Operating with a duty cycle of 100% automatically reduces the duty cycle to approximately 95% on every fifth cycle to allow this capacitor to recharge.

**Voltage-Sense Node, VSENSE** An internal resistor between VREG and this pin and another internal resistor between this pin and ground form the voltage-sense network. This pin is the inverting input for the error amplifier of the control loop. This input is compared to an internal reference of 2 V for the control circuitry.

**Error Amplifier Output, COMP** The error amplifier output forms a compensation network for the voltage mode control topology. The amplifier changes state with increase in voltage output on this pin.

**Internal Regulated Boot Supply, BOOT\_LDO** The internally regulated supply acts as a refresh power source for the bootstrap capacitor every switching cycle. An external capacitor to ground is needed to stabilize the voltage source.

**Clock Pulse, RT/CLK** A resistor to ground on this pin sets the buck converter switching frequency. Alternatively, an external clock input on this pin overrides the internal free-running clock (default value) by detecting positive edges of consecutive pulses and synchronizing to the external input signal. If the external clock input is removed, the system synchronizes to the internal clock signal of 2.2 MHz.

**Output Voltage, VREG** This pin represents the buck (step-down) output voltage VREG of the converter. The output voltage of the buck-mode regulator is fixed at 5.3 V. This output requires a ceramic capacitor (4.7  $\mu$ F to 10  $\mu$ F range).

**Ignition Enable Input, IGN\_EN** The IGN\_EN pin acts as an enable/disable input to activate the step-down power-supply output. The input is high-voltage tolerant up to 45 V. An internal resistor limits current into this pin for such high input voltage.

**Logic Level Enable Input, EN** The EN pin is a logic-level disable input to all outputs when IGN\_EN is low and all outputs are active.

**Regulated Output, 5V** This pin is the regulated output and requires a low-ESR ceramic capacitor to ground for loop stabilization. This capacitor must be placed close to the pin of the IC. The output requires larger capacitance to compensate for wide load transient steps.

**Power-On Delay, DELAY** A capacitor on this pin sets the desired delay time. The output of this pin provides a source current to charge the external capacitor once the VREG, 3.3 V and 1.234 V supplies have all exceeded the internally set threshold (0.9  $\times$  their respective regulated supply values).

**3.3-V Drive Output, 3.3VDRIVE** This pin provides an output to drive an external bipolar transistor (BJT) for the 3.3 V supply. The output is protected by current limiting of both the source and sink capabilities.

**3.3-V Voltage Sense, 3.3VSENSE** This pin is the voltage node of 3.3 V supply. Voltage of approximately 1.65 V on this pin initiates a current foldback during shorts on the regulated output.

**1.2-V Drive Output, 1.2VDRIVE** This pin provides an output to drive an external bipolar transistor (BJT) for the 1.234 V supply. The output is protected by current limiting of both the source and sink capabilities.

**1.2-V Voltage Sense, 1.2VSENSE** This pin is the voltage node of 1.234 V supply. Voltage of approximately 0.6 V on this pin initiates a current foldback during shorts on the regulated output.

**Soft Start, SS** A ceramic capacitor is connected from this pin to ground to set a soft-start timer for the buck regulator supply. There is an internal pullup current source of 50  $\mu$ A typical, which is activated on IGN\_EN to charge the external capacitor on the SS pin.

## Feature Description (continued)

**Input Voltage, VIN** The VIN pin is the input power source for the device. This pin must be externally protected against voltage levels greater than 45 V and against a reversed battery. This input line requires a filter capacitor to minimize noise. Additionally, for EMI considerations, an input filter inductor may also be required.

**Reset Indicator, nRST** The nRST pin is an open-drain output. The power-on reset output is asserted low until the output voltages on the VREG, 3.3 V, and 1.234 V supplies exceed their set thresholds and the power-on delay timer has expired. Additionally, whenever the IGN\_EN and EN\_LIN\_REG pins are low or open, nRST is immediately asserted low regardless of the output voltage. If a thermal shutdown occurs due to excessive thermal, conditions this pin is asserted low.

**Ignition Input Status, IGN\_ST** The IGN\_ST pin is an open-drain output. This output indicates whether input signal IGN\_EN is present. Additionally, whenever the IGN pin is low or open, IGN\_ST is immediately asserted low.

**Power Ground, PGND** Power ground pin, which is internally connected to the exposed thermal pad.

**Ground, GND** Signal ground pin, which is internally connected to the exposed thermal pad.

### 7.3.2 Buck Converter

#### 7.3.2.1 PWM Operation

The switch-mode power supply (SMPS) operates in a fixed-frequency adaptive on-time control pulse-width modulation (PWM). The switching frequency is set by an external resistor or synchronized with an external clock input. The internal N-channel MOSFET is turned on (SET) at the beginning of each cycle. This MOSFET is turned off (RESET) when the PWM comparator resets the latch. When the high external FET is turned OFF, the external Schottky diode recirculates the energy stored in the inductor for the remainder of the switching period.

The external bootstrap capacitor acts as a voltage supply for the internal high side MOSFET. This capacitor is recharged on every recirculation cycle (when the internal high-side MOSFET is turned OFF). In the case of commanding 100% duty cycle for the internal high side MOSFET, the device automatically reverts to 87% to allow the bootstrap capacitor to recharge.

#### 7.3.2.2 Voltage-Mode Control Loop

The voltage-mode control monitors the set output voltage and processes the signal to control the internal MOSFET. A voltage feedback signal is compared to a constant ramp waveform, resulting in a PWM modulation pulse. An input line-voltage feedforward technique is incorporated to compensate for changes in the input voltage and ensures the output voltage is stable by adjusting the ramp waveform for the correct duty cycle. The internal MOSFET is protected from excess power dissipation with a current-limit and frequency foldback circuitry during an output-to-ground short-circuit event.

A combination of internal and external components forms a compensation network to ensure error-amplifier gain does not cause instability because of input voltage changes or load perturbations.

#### 7.3.2.3 Output Voltage 5.3 V (VREG)

The output voltage VREG is generated by the converter supplied from the battery voltage VIN and the external components (L, C). The output is sensed through an internal resistor divider and compared with an internal reference voltage.

This output requires larger output capacitors (4.7- $\mu$ F to 10- $\mu$ F range) to ensure that during load transients the output does not drop below the reset threshold for a period longer than the reset deglitch filter time.

An internal load is enabled for a short period when the following occurs:

- A start-up condition occurs, that is, during power up or when IGN\_EN or EN is toggled.
- An overvoltage condition exists on this output.

## Feature Description (continued)

### 7.3.2.4 Switching Frequency (RT/CLK)

The oscillator frequency of the buck regulator is selectable by means of a resistor placed at the RT/CLK pin to ground. The switching frequency ( $f_{SW}$ ) can be set in the range 2 MHz to 3 MHz in this resistor mode. Alternatively, if there is an external clock input signal, the internal oscillator synchronizes to this signal within 10  $\mu$ s.

The [Equation 1](#) calculates the value of resistor (RT) for the required switching frequency  $f_{SW}$ .

$$RT = \frac{98.4 \times 10^9}{f_{SW}} \quad (\text{Ohms}) \quad (1)$$

### 7.3.2.5 Boost Capacitor (BOOT)

This capacitor provides the gate-drive voltage for the internal MOSFET switch. X7R and X5R grade dielectrics are recommended because of their stable values over temperature. Selecting a lower value of boost capacitor for low-Vreg, high-frequency, or both types of applications, or selecting a higher value for high-Vreg, low-frequency, or both types of applications (for example, 100 nF for 500 kHz/5 V and 220 nF for 500 kHz/8 V) may be necessary. In general, a 0.1- $\mu$ F capacitor is used for the boot capacitor.

### 7.3.2.6 Soft Start (SS)

To limit the start-up inrush current for the switch-mode supply, an internal soft-start circuit is used to ramp up the reference voltage from 0 V to the final value of 0.8 V. The regulator uses the internal reference or the SS-pin voltage as the power-supply reference voltage to regulate the output accordingly. Use [Equation 2](#) to calculate the soft-start timing.

$$\text{Time } (t_{SS}) = \frac{C \times 0.8 \text{ V}}{50 \times 10^{-6}}$$

where

- C = Capacitor on the SS pin, typically 0.1  $\mu$ F or lower (2)

### 7.3.2.7 Power-On Delay (DELAY)

The power-on delay function delays the release of the nRST line. The method of operation is to detect when all VREG (5.3-V), 3.3-V, and 1.234-V power-supply outputs are above 90% (typical) of the set value. This detection then triggers a current source to charge the external capacitor on the DELAY pin. When this capacitor is charged to approximately 2 V, the nRST line is asserted high. The delay time is calculated using [Equation 3](#).

$$t_{DELAY} = \frac{2 \text{ V} \times C}{2 \mu\text{A}}$$

where

- C = capacitor on DELAY pin.

Example: For a 20-ms delay, C = 20 nF. (3)

### 7.3.2.8 Reset (nRST)

The nRST pin is an open-drain output. The power-on reset signal is a voltage-supervisor output to indicate the output voltages on VREG (5.3 V), 3.3 V, and 1.234 V are within the specified tolerance of the set regulated voltages. Additionally, whenever both the IGN\_EN and EN pins are low or open, the nRST pin is immediately asserted low regardless of the output voltage. If a thermal shutdown occurs because of excessive thermal conditions, this pin is asserted low.

Conversely on power down, when the VREG or 3.3-V or 1.234-V output voltage falls below 90% of the respective set threshold, the nRST pin is pulled low after a de-glitch filter delay of approximately 15  $\mu$ s (maximum). This feature is implemented to prevent nRST from being invoked because of noise on the output supplies.

## Feature Description (continued)

### 7.3.2.9 Thermal Shutdown

This device has independent two thermal sensing circuits for the VREG (5.3 V), 5-V regulators; if either one of these circuits detects the power FET junction temperature to be greater than the set threshold, that particular output-power switch is turned OFF. The appropriate FET turns back ON once it is allowed to cool sufficiently. The thermal sensing and shutdown circuitry is only activated when nRST is high.

### 7.3.2.10 Reset Function

On power up, ALL three regulated supplies, VREG, 3.3 V, and 1.234 V, must be more than 90% of their respective values before the delay timer capacitor on the DELAY pin can start charging.

On power down, if any one of the three regulated supplies, VREG, 3.3 V, or 1.234 V, drops below 90% of its value, nRST is asserted low after a small deglitch filter time. Once nRST is asserted low, it can only go high again after ALL three supplies are above the 90% value and the DELAY pin voltage is higher than 2 V.

Figure 12. Reset Function

## Feature Description (continued)

### 7.3.3 Linear Regulators

#### 7.3.3.1 Fixed Linear Regulator Output (5.3 V)

This linear regulator is a fixed, regulated output of 5.3 V  $\pm 2\%$  over temperature and input supply using a precision voltage-sense resistor network. A low-ESR ceramic capacitor is required for loop stabilization; this capacitor must be placed close to the pin of the IC. This output is protected against shorts to ground by a foldback current limit for safe operating conditions, and a current-limit for limiting inrush current because of depleted charge on the output capacitor. Initial IGN\_EN or EN initiates power cycle of the soft-start circuit on this regulator. This typically is in the 1-ms to 2-ms range. This output may require a larger output capacitor to ensure that during load transients the output does not drop below the required regulated specifications.

#### 7.3.3.2 Fixed Linear Regulator Controller (3.3 V)

The linear regulator controller requires an external NPN bipolar pass transistor of sufficient gain stage to support the maximum load current required. The base-drive output current is protected by current limiting both the source and sink drive circuitry. The 3.3VSENSE pin is the remote sense input of the output of the REG3 supply and controls the 3.3VDRIVE output accordingly. This regulator is a fixed 3.3-V with  $\pm 2\%$  tolerance using a precision voltage-sense resistor network. A low-ESR ceramic output capacitor is used for loop compensation of the regulator. A voltage on this pin of less than approximately 50% of the regulated value initiates a current limit on the 3.3VDRIVE output.

This output may require larger output capacitors to support load transients, so the output does not drop below 90% of 3.3 V.

#### 7.3.3.3 Fixed Linear Regulator Controller (1.2 V)

The linear regulator controller requires an external NPN bipolar pass transistor of sufficient gain stage to support the maximum load current required. The 1.2VSENSE pin is the remote sense input of the output of 1.234-V supply and controls the 1.2VDRIVE output accordingly. This regulator output is 1.234 V with  $\pm 2\%$  tolerance using a precision voltage-sense resistor network. A low-ESR ceramic output capacitor is used for loop compensation of the regulator. A voltage on this pin of less than approximately 50% of the regulated value initiates a current limit on the 1.2VDRIVE output.

This output may require larger output capacitors to support load transients, so the output does not drop below 90% of 1.234 V.

## 7.4 Device Functional Modes

### 7.4.1 Operational Mode

The purpose of the EN input is to keep the regulated supplies ON for a period for the microprocessor to log information into the memory locations when the ignition input is disabled. The microprocessor disables the power supplies by pulling EN low after this activity is complete.

### 7.4.2 Buck Converter Modes of Operation

The converter operates in different modes based on load current, input voltage, and component selection.

## Device Functional Modes (continued)

### 7.4.2.1 Continuous-Conduction Mode (CCM)

This mode of operation is typically when the inductor current is non-zero and the load current is greater than  $I_{L\_CCM}$ .

$$I_{IND\_CCM} \geq \frac{(1-D) \times V_{REG}}{2 \times f_{SW} \times L}$$

where

- $I_{IND\_CCM}$  = Inductor current in continuous-conduction mode
- $D$  = duty cycle
- $V_{REG}$  = output voltage
- $L$  = Inductor
- $f_{SW}$  = switching frequency

(4)

In this mode, the duty cycle must always be greater than the minimum  $t_{ON}$  or the converter may go into burst mode.

### 7.4.2.2 Discontinuous Mode (DCM)

$$I_{IND\_DCM} \geq \frac{(1-D) \times V_{REG}}{2 \times f_{SW} \times L}$$

(5)

This mode of operation is typically when the inductor current goes to zero and the load current is less than  $I_{IND\_DCM}$ .

### 7.4.2.3 Tracking Mode

When the input voltage is low and the converter approaches approximately 100% duty cycle, [Equation 6](#) calculates the output voltage.

$$V_{REG} = \left( 1 - \frac{t_{OFF\_MIN}}{T} \right) \times (V_{IN} - I_{LOAD} \times R_{DS})$$

where

- $T$  = Period
- $R_{DS}$  = Internal FET resistance
- $I_{LOAD}$  = output load current

(6)

## 8 Application and Implementation

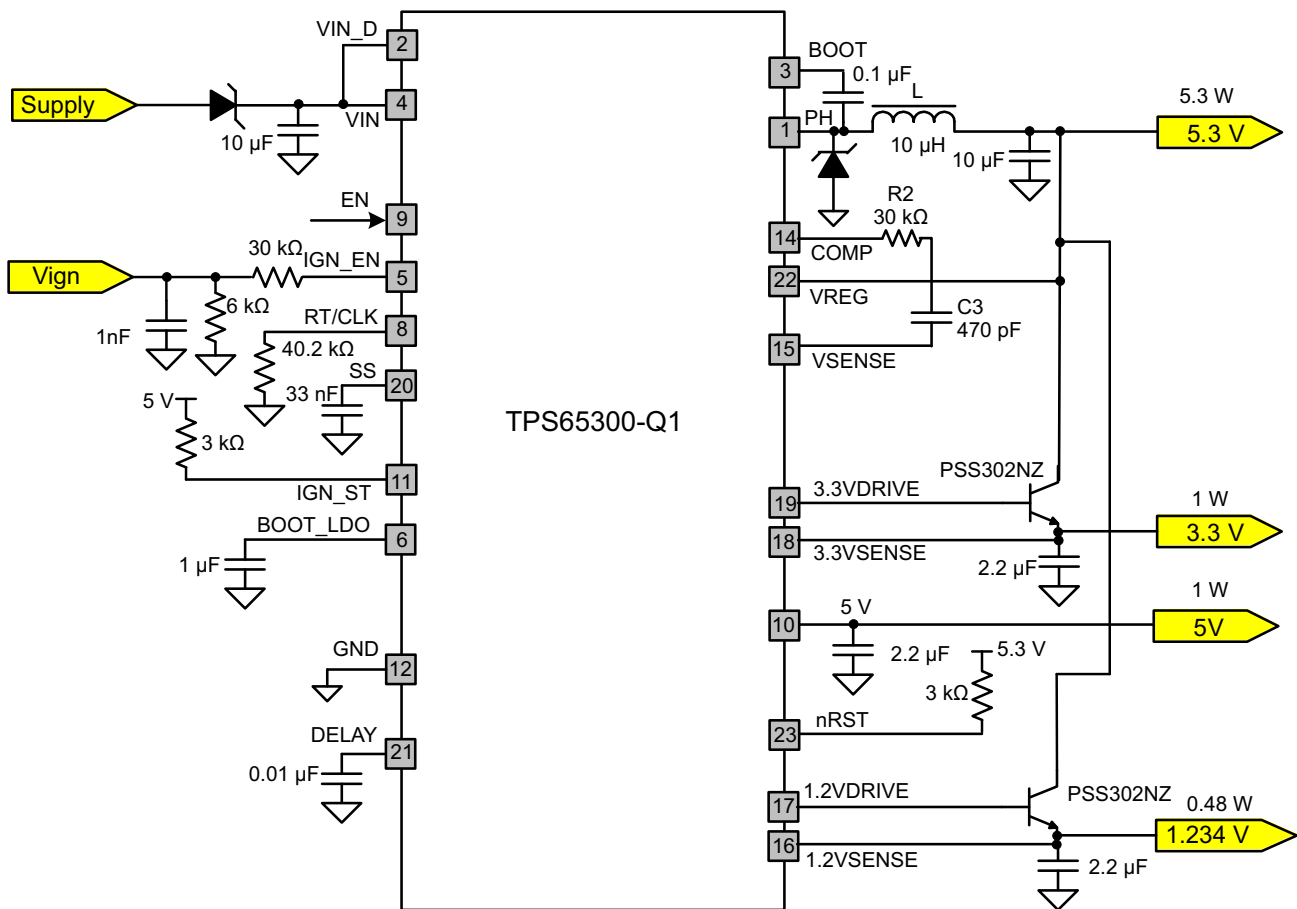

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

This section is a starting point and theoretical representation of the values to be used for the application, further optimization of the components derived may be required to improve the performance of the device.

### 8.2 Typical Application

L: B82462G4103MOOO (EPCOS) or XFL4020 472MEB (Coilcraft)  
 S1: MBR310T3 (ON Semiconductors) or SS3H10 (Vishay)  
 S2: B240A, SS16 (Vishay)  
 External BJT: PBSS302NZ (NXP)

**Figure 13. Application Schematic for a Switching Regulator**

## Typical Application (continued)

### 8.2.1 Design Requirements

For this design example, use the parameters listed in [Table 1](#).

**Table 1. Switching Regulator Requirements**

Parameter	Requirement
Input voltage, $V_I$	6.5 V to 27 V, typical 14 V
Output voltage, 5.3 V	$5.3 V_O \pm 2\%$ at 5.3 W
Maximum output current $I_{5.3V\_max}$	1 A
Minimum output current $I_{5.3V\_min}$	0.01 A
Transient response 0.01A to 0.8 A	5%
Reset threshold	90% of output voltage
5V	$5V_O$ at 1 W
3.3V	$3.3V_O$ at 1 W
1.234V	$1.234V_O$ at 0.5 W
Switching frequency $f_{SW}$	2.5 MHz
Overshoot threshold	106% of output voltage
Undervoltage threshold	95% of output voltage

### 8.2.2 Detailed Design Procedure

The following design procedure provides typical application procedures as well as the details of a switching regulator design using the requirements listed in [Table 1](#).

#### 8.2.2.1 Duty Cycle

Use [Equation 7](#) to calculate the duty cycle.

$$D = \frac{V_O}{V_I} = \frac{5.3}{14} = 0.378$$

where

- $V_O$  = Output voltage
- $V_I$  = Input voltage

(7)

#### 8.2.2.2 Output Inductor Selection (L)

The minimum inductor value is calculated using the coefficient  $K_{IND}$  that represents the amount of inductor ripple current relative to the maximum output current. The inductor ripple current is filtered by the output capacitor, and so the typical range of this ripple current is in the range of  $K_{IND} = 0.2$  to  $0.3$ , depending on the ESR and the ripple-current rating of the output capacitor.

For this design example, use [Equation 8](#) to calculate the inductor ripple current

$$I_{Ripple} = K_{IND} \times I_O = 0.25 \times 1 = 0.25 \text{ A}$$

where

- $I_O$  = Output current

(8)

#### Benefits of Low Inductor Value

- Low inductor value gives high  $di/dt$ , which allows for fewer output capacitors for good load transient response.
- Gives higher saturation current for the core due to fewer turns
- Fewer turns yields low DCR and therefore less dc inductor losses in the windings.
- High  $di/dt$  provides faster response to load steps.

#### Benefits of High Inductor Value

- Low ripple current leads to lower conduction losses in MOSFETs
- Low ripple; means lower RMS ripple current for capacitors

- Low ripple; yields low ac inductor losses in the core (flux) and windings (skin effect)
- Low ripple; gives continuous inductor current flow over a wide load range

For this design example a value of 10  $\mu\text{H}$  was selected because of variations in temperature and manufacture. Use Equation 9 to find the value of  $L_{\text{Min}}$ .

$$L_{\text{Min}} = \frac{(V_{\text{I-Max}} - V_{\text{O}}) \times V_{\text{O}}}{f_{\text{SW}} \times I_{\text{RIPPLE}} \times V_{\text{I-Max}}} = \frac{(27 - 5.3) \times 5.3}{2.5 \text{ MHz} \times 10^6 \times 0.25 \times 27} = 6.8 \mu\text{H}$$

where

- $f_{\text{SW}}$  is the regulator switching frequency
- $I_{\text{Ripple}}$  = Allowable ripple current in the inductor, typically  $\pm 20\%$  of maximum output load  $I_{\text{O}}$

For this design example, use Equation 10 to calculate the inductor peak current.

$$I_{\text{L-Peak}} = I_{\text{O}} + \frac{I_{\text{Ripple}}}{2} = 1 + \frac{0.25}{2} = 1.125 \text{ A} \quad (10)$$

### 8.2.2.3 Output Capacitor Selection ( $C_{\text{O}}$ )

The selection of the output capacitor determines several parameters in the operation of the converter, the modulator pole, the voltage droop on the out capacitor, and the output ripple.

During a load step from no load to full load or changes in the input voltage, the output capacitor must hold up the output voltage above a certain level for a specified time and not issue a reset until the main regulator control loop responds to the change. The capacitance value determines the modulator pole and the roll-off frequency due to because of the LC output-filter double pole—the output ripple voltage is a product of the output capacitor ESR and ripple current.

Use Equation 11 to calculate the minimum capacitance required to maintain desired output voltage during a high-to-low load transition and prevent overshoot.

$$C_{\text{O}} = \frac{L((I_{\text{O-max}})^2 - (I_{\text{O-min}})^2)}{(V_{\text{O-max}})^2 - (V_{\text{O-min}})^2} = \frac{10 \times 10^{-6} [(1)^2 - (0.01)^2]}{(5.45)^2 - (5.15)^2} = 3.18 \mu\text{F}$$

where

- $I_{\text{O-max}}$  is maximum output current
- $I_{\text{O-min}}$  is minimum output current
- The difference between the output current, maximum to minimum, is the worst-case load step in the system.
- $V_{\text{O-max}}$  is maximum tolerance of regulated output voltage
- $V_{\text{O-min}}$  is the minimum tolerance of regulated output voltage

Use Equation 12 to calculate the output capacitor root-mean-square (RMS) ripple current  $I_{\text{O-RMS}}$ . This is to prevent excess heating or failure due to high ripple currents.

This parameter is sometimes specified by the manufacturer. Therefore, because of variations in temperature and manufacture, use a 10- $\mu\text{F}$  capacitor with a voltage rating greater than the maximum 10-V output.

$$I_{\text{O-RMS}} = \frac{L((I_{\text{O-max}})^2 - (I_{\text{O-min}})^2)}{(V_{\text{O-max}})^2 - (V_{\text{O-min}})^2} = \frac{5.3 \times (27 - 5.3)}{\sqrt{12} \times 27 \times 10 \times 10^{-6} \times 2.5 \times 10^6} = 0.049 \text{ A} \quad (12)$$

### 8.2.2.4 External Schottky Diode (D)

The TPS65300-Q1 device requires an external ultrafast Schottky diode with fast reverse-recovery time connected between the PH and power ground pins. The diode conducts the output current during the off-state of the internal power switch. This diode must have a reverse breakdown higher than the maximum input voltage of the application. A Schottky diode is selected for lower forward voltage. The Schottky diode is selected based on the appropriate power rating, which factors in the DC-conduction losses and the AC losses because of the high switching frequencies. The power dissipation  $P_D$  is calculated with [Equation 13](#).

$$P_D = I_O \times V_{FD} \times (1-D) + \frac{(V_I - V_{FD})^2 \times f_{SW} \times C_J}{2} = 1 \times 0.55 \times (1 - 0.378) + \frac{(14 - 0.55)^2 \times 2.5 \text{ MHz} \times 30 \text{ pF}}{2} = 0.34 \text{ W}$$

where

- $V_{FD}$  = forward conducting voltage of Schottky diode
  - $C_J$  = junction capacitance of the Schottky diode
- (13)

### 8.2.2.5 Input Capacitor (C<sub>I</sub>)

The TPS65300-Q1 device requires an input ceramic decoupling capacitor type X5R or X7R and bulk capacitance to minimize input ripple voltage. The DC voltage rating of this input capacitance must be greater than the maximum input voltage. The capacitor must have an input ripple-current rating higher than the maximum input ripple current of the converter for the application. The input capacitors for power regulators are selected to have reasonable capacitance-to-volume ratio and to be fairly stable over temperature. The value of the input capacitance is based on the input voltage desired ( $\Delta V_I$ ).

Use [Equation 14](#) to calculate the input capacitance.

$$C_I = \frac{I_{O\_max} \times 0.25}{\Delta V_I \times f_{SW}} = \frac{1 \times 0.25}{0.3 \times 2.5 \text{ MHz}} = 0.33 \text{ } \mu\text{F}$$
(14)

Use [Equation 15](#) to calculate the input-capacitor root-mean-square (RMS) ripple current  $I_{I\_RMS}$ .

Because of variations in temperature and manufacture, use a 10- $\mu\text{F}$  capacitor with a voltage rating greater than the maximum 45-V transient.

$$I_{I\_RMS} = I_O \times \sqrt{\frac{V_O}{V_{I\_min}} \times \left( \frac{V_{I\_min} - V_O}{V_{I\_min}} \right)} = 1 \times \sqrt{\frac{5.3}{6} \times \left( \frac{6 - 5.3}{6} \right)} = 0.32 \text{ A}$$
(15)

### 8.2.2.6 Loop Compensation

The double pole is because of the output-filter components inductor and capacitor. The calculations for the following equations use values taken from [Figure 14](#).

### 8.2.2.7 Loop-Control Frequency Compensation

### Type III Compensation

Figure 14. Loop-Control Frequency Compensation

#### 8.2.2.7.1 Type III Compensation

$f_{CO} = f_{SW} \times 0.1$  (the cutoff frequency when the gain is 1 is called the unity-gain frequency).

$f_{CO}$  is typically 1/5 to 1/10 of the switching frequency double-pole frequency response due to the LC output filter. The LC output filter gives a *double pole*, which has a  $-180^\circ$  phase shift.

Make the two zeroes close to the double pole (LC), for example,  $f_{z1} \approx f_{z2} \approx 1/2\pi(LC_{OUT})^{1/2}$ .

1. Make the first zero below the filter double pole (approximately 50% to 75% of  $f_{LC}$ )
2. Make the second zero at the filter double pole ( $f_{LC}$ )

Make the two poles above the crossover frequency  $f_{CO}$ .

3. Make the first pole at the ESR frequency ( $f_{ESR}$ )
4. Make the second pole at 0.5 the switching frequency

The following compensation components are integrated in the device with the following typical values. Guidelines for compensation components:

$R3 = 8 \text{ k}\Omega$ ,  $C4 = 140 \text{ pF}$ ,  $C2 = 20 \text{ pF}$

Use Equation 16 to calculate the double pole to calculate the output filter components LC.

$$f_{LC} = \frac{1}{2\pi\sqrt{LC_O}} = \frac{1}{2\pi\sqrt{10 \mu\text{H} \times 10 \mu\text{F}}} = 15.9 \text{ kHz} \quad (16)$$

The ESR of the output capacitor C gives a zero that has a  $90^\circ$  phase shift. The ESR of the output capacitor must be in the range of 1 mΩ to 100 mΩ. Use Equation 17 to calculate the value of  $f_{ESR}$ .

$$f_{ESR} = \frac{1}{2\pi \times C_O \times \text{ESR}} = \frac{1}{2\pi \times 10 \mu\text{F} \times 0.005} = 3.2 \text{ MHz} \quad (17)$$

**8.2.2.7.2 PWM Modulator Gain K**

$$K = \frac{V_I}{V_{\text{ramp}}}$$

where

- $V_{\text{ramp}} = V_I / 10$ ,  $V_I =$  Input operating voltage (18)

**8.2.2.7.3 Resistor Values**

In this design example, select a value of 97.4 k $\Omega$  for R5 and use [Equation 19](#) to calculate the value of R4.

$$R4 = \frac{R5 \times (V_O - V_{\text{ref}})}{V_{\text{ref}}} = \frac{97.4 \text{ k}\Omega \times (5.3 - 2)}{2} = 160.7 \text{ k}\Omega$$

where

- $V_{\text{ref}} = 2 \text{ V}$  (19)

Use [Equation 20](#) to calculate the value of R2 for this design example.

$$R2 = \frac{f_{\text{CO}} \times V_{\text{ramp}} \times R4}{f_{\text{LC}} \times V_I} = \frac{250 \text{ kHz} \times 1.4 \times 160 \text{ k}\Omega}{15.9 \text{ kHz} \times 14} = 251.6 \text{ k}\Omega \quad (20)$$

Calculate C3 based on placing a zero at 50% to 75% of the output-filter double-pole frequency (below set at 50%).

For this design example, use [Equation 21](#) to calculate the value of C3 as 80 pF.

$$C3 = \frac{1}{\pi \times R2 \times f_{\text{LC}}} = \frac{1}{\pi \times 251.6 \text{ k}\Omega \times 15.9 \text{ kHz}} = 80 \text{ pF} \quad (21)$$

**8.2.2.7.4 Gain of Amplifier**

$$A_V = \frac{R2 \times (R4 + R3)}{(R4 \times R3)} \quad (22)$$

**8.2.2.7.5 Poles and Zero Frequencies**

The following equations were used in this design example:

$$f_{\text{P1}} = \frac{1}{2\pi \times R2 \times C2} = \frac{1}{2\pi \times 251.6 \text{ k}\Omega \times 20 \text{ pF}} = 31.6 \text{ kHz}$$

$$f_{\text{P2}} = \frac{1}{2\pi \times R3 \times C4} = \frac{1}{2\pi \times 8 \text{ k}\Omega \times 140 \text{ pF}} = 142.1 \text{ kHz}$$

$$f_{\text{Z1}} = \frac{1}{2\pi \times R2 \times C3} = \frac{1}{2\pi \times 251.6 \text{ k}\Omega \times 80 \text{ pF}} = 7.91 \text{ kHz}$$

$$f_{\text{Z2}} = \frac{1}{2\pi \times R4 \times C4} = \frac{1}{2\pi \times 160.7 \text{ k}\Omega \times 140 \text{ pF}} = 7.07 \text{ kHz} \quad (23)$$

Figure 15. Typical Gain Versus Frequency

### 8.2.2.8 Power Dissipation

#### 8.2.2.8.1 Switch-Mode Power-Supply Losses

The power dissipation losses are applicable for continuous-conduction mode operation (CCM).

##### 1. Conduction losses

$$P_{5.3V\_CON} = I_O^2 \times R_{ds(on)} \times (V_O/V_I)$$

where

- $I_O$  = Output current
- $V_O = V_{REG}$  = Output voltage
- $V_I$  = Input voltage
- $f_{SW}$  = Switching frequency

(24)

##### 2. Switching losses

$$P_{5.3V\_SW} = \frac{1}{2} \times V_I \times I_O \times (t_r + t_f) \times f_{SW}$$

where

- $t_r$  = FET switching rise time ( $t_r$  max = 20 ns)
- $t_f$  = FET switching fall time ( $t_f$  max = 20 ns)

(25)

##### 3. Gate drive losses

$$P_{5.3V\_Gate} = V_{drive} \times Q_g \times f_{SW}$$

where

- $V_{drive}$  = FET gate-drive voltage (typically  $V_{drive} = 6$  V and  $V_{drive}$  max = 8 V)
- $Q_g = 1 \times 10^{-9}$  (nC) (typical)

(26)

##### 4. Supply losses

$$P_{IC} = V_I \times I_{q-normal}$$

(27)

Therefore:

$$P_{Total} = P_{CON} + P_{SW} + P_{Gate} + P_{5V\_Lin Reg} + P_{IC}$$

(28)

$$P_{5V\_Lin\ Reg} = (V_{REG} - 5\text{ V}) \times I_O \quad (29)$$

Therefore, for this design, the following equations were used:

$$P_{5.3V\_CON} = I_O^2 \times r_{ds(on)} \times (V_O / V_I) = 1^2 \times 0.5 \times (5.3 / 14) = 0.189\text{ W}$$

$$\begin{aligned} P_{5.3V\_SW} &= 1/2 \times V_I \times I_O \times (t_r + t_f) \times f_{SW} \\ &= 1/2 \times 14 \times 1 \times (20 \times 10^{-9} + 20 \times 10^{-9}) \times 2.5 \times 10^6 = 0.7\text{ W} \end{aligned}$$

$$P_{5.3V\_Gate} = V_{drive} \times Q_g \times f_{SW} = 8 \times 1 \times 10^{-9} \times 2.5 \times 10^6 = 0.02\text{ W}$$

$$P_{5V\_Lin\ Reg} = (V_{REG} - 5V) \times I_O = (5.3 - 5.0) \times 0.2 = 0.06\text{ W}$$

$$P_{IC} = V_I \times I_{IC} = 14 \times 5\text{ mA} = 0.07\text{ W}$$

$$\begin{aligned} P_{Total} &= P_{5.3V\_CON} + P_{5.3V\_SW} + P_{5.3V\_Gate} + P_{5V\_Lin\ Reg} + P_{IC} \\ &= 0.189 + 0.7 + 0.02 + 0.06 + 0.07 = 1.039\text{ W} \end{aligned} \quad (30)$$

For given operating ambient temperature  $T_A$

$$T_J = T_A + R_{th} \times P_{Total}$$

where

- $T_J$  = Junction temperature in °C
- $T_A$  = Ambient temperature in °C
- $P_{Total}$  = Total power dissipation (watts) (31)

For a given max junction temperature  $T_{J-Max} = 150^\circ\text{C}$

$$T_{A-Max} = T_{J-Max} - R_{th} \times P_{Total}$$

where

- $T_{A-Max}$  = Maximum ambient temperature in °C
- $T_{J-Max}$  = Maximum junction temperature in °C
- $R_{th}$  = Thermal resistance of package in (°C/W) (32)

Other factors not included in the foregoing information which affect the overall efficiency and power losses are

- Inductor AC and DC losses
- Trace resistance and losses associated with the copper trace routing connection
- Schottky diode

Figure 16. Power Dissipation Derating Profile, 24-Pin PWP Package With Thermal Pad

### 8.2.3 Application Curves

Figure 17. Efficiency vs Output Current on VREG

Figure 18. Load Transient Response, 10 mA to 200 mA

Figure 19. Load Transient Response, 10 mA to 350 mA

## 9 Power Supply Recommendations

The TPS65300-Q1 device is designed to operate using an input supply voltage range from 5.6 V to 40 V.

## 10 Layout

### 10.1 Layout Guidelines

The following guidelines are recommended for the printed circuit board (PCB) layout of the TPS65300-Q1 device.

#### 10.1.1 Inductor L

Use a low-EMI inductor with a ferrite-type shielded core. Other types of inductors may be used; however, they must have low-EMI characteristics and be located away from the low-power traces and components in the circuit.

#### 10.1.2 Input Filter Capacitors $C_i$

Input ceramic filter capacitors should be located in close proximity to the VIN pin. Surface-mount capacitors are recommended to minimize lead length and reduce noise coupling.

#### 10.1.3 Feedback

Route the feedback trace such that there is minimum interaction with any noise sources associated with the switching components. Recommended practice is to ensure placing the inductor away from the feedback trace to prevent a source of EMI noise.

#### 10.1.4 Traces and Ground Plane

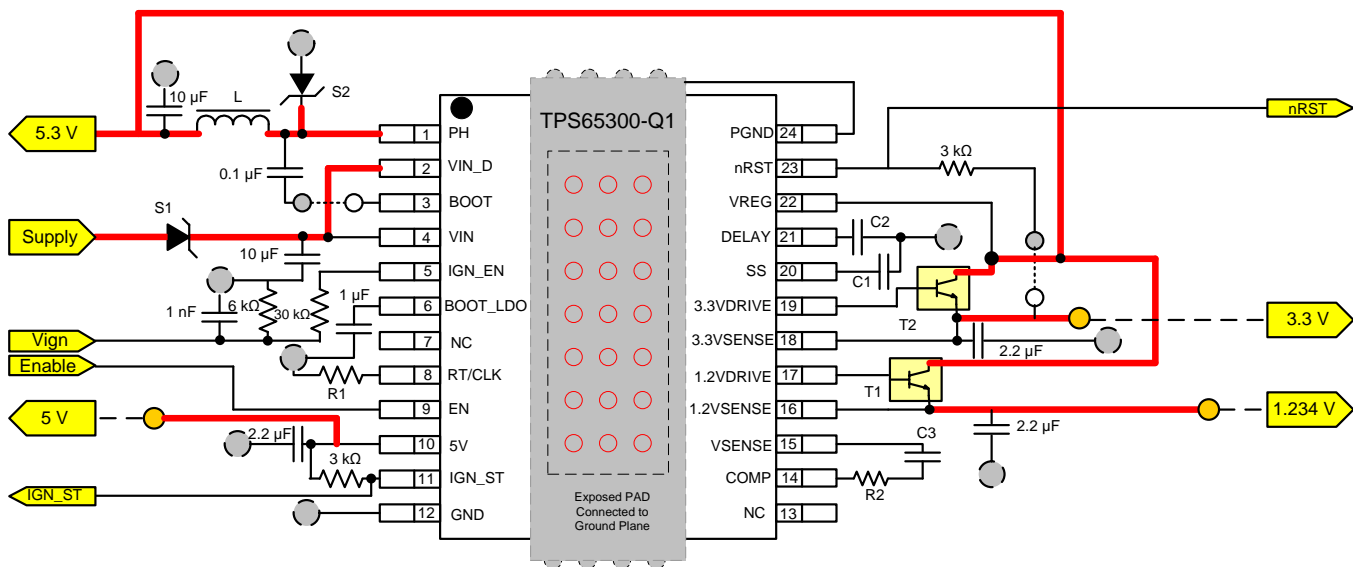

All power (high-current) traces should be thick and as short as possible. The inductor and output capacitors should be as close to each other as possible. This reduces EMI radiated by the power traces due to high switching currents.

In a two-sided PCB it is recommended to have ground planes on both sides of the PCB to help reduce noise and ground-loop errors. The ground connection for the input and output capacitors and IC ground should be connected to this ground plane.

In a multi-layer PCB, the ground plane is used to separate the power plane (where high switching currents and components are placed) from the signal plane (where the feedback trace and components are) for improved performance.

Also arrange the components such that the switching-current loops curl in the same direction. Place the high-current components such that during conduction the current path is in the same direction. This prevents magnetic field reversal caused by the traces between the two half-cycles, helping to reduce radiated EMI.

## 10.2 Layout Example

- Connection to backside of PCB through vias
- Connection to topside of PCB through vias
- Connection to ground plane of PCB through vias
- Power bus
- Voltage Output rails

T1, T2 are PSS302NZ, sufficient heat sink may be required for power dissipation

Figure 22. PCB Layout

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

### 11.2 Documentation Support

#### 11.2.1 Related Documentation

For related documentation see the following:

User's Guide, *TPS65300EVM*, [SLVU685](#)

### 11.3 Community Resource

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](#), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 11.4 Trademarks

PowerPAD, E2E are trademarks of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65300QPWRQ1	ACTIVE	HTSSOP	PWP	24	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 125	TPS65300	<a href="#">Samples</a>
TPS65300QRHFRQ1	ACTIVE	VQFN	RHF	24	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 125	65300Q1	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# THERMAL PAD MECHANICAL DATA

## PWP (R-PDSO-G24) PowerPAD™ SMALL PLASTIC OUTLINE

### THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in thermal pad.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
