

UCC2871x Constant-Voltage, Constant-Current Controller With Primary-Side Regulation

1 Features

- < 10-mW No-Load Power
- Primary-Side Regulation (PSR) Eliminates Opto-Coupler
- $\pm 5\%$ Voltage and Current Regulation Across Line and Load
- 700-V Start-Up Switch
- 100-kHz Maximum Switching Frequency Enables High-Power Density Charger Designs
- Resonant Valley-Switching Operation for Highest Overall Efficiency
- Frequency Jitter to Ease EMI Compliance
- Wide VDD Range Allows Small Bias Capacitor
- Clamped Gate-Drive Output for MOSFET
- Overvoltage, Low-Line, and Overcurrent Protection Functions
- Programmable Cable Compensation (UCC28710)
- NTC Resistor Interface (UCC28711, UCC28712 and UCC28713) with Fixed Cable Compensation Options
- SOIC-7 Package
- Create a Custom Design Using the UCC28710 With the [WEBENCH® Power Designer](#)

2 Applications

- USB-Compliant Adapters and Chargers for Consumer Electronics
 - Smart Phones
 - Tablet Computers
 - Cameras
- Standby Supply for TV and Desktop
- White Goods

3 Description

The UCC2871x family of flyback power supply controllers provides isolated-output Constant-Voltage (CV) and Constant-Current (CC) output regulation without the use of an optical coupler. The devices process information from the primary power switch and an auxiliary flyback winding for precise control of output voltage and current.

An internal 700-V start-up switch, dynamically-controlled operating states and a tailored modulation profile support ultra-low standby power without sacrificing start-up time or output transient response.

Control algorithms in the UCC28710 family allow operating efficiencies to meet or exceed applicable standards. The output drive interfaces to a MOSFET power switch. Discontinuous conduction mode (DCM) with valley switching reduces switching losses. Modulation of switching frequency and primary current peak amplitude (FM and AM) keeps the conversion efficiency high across the entire load and line ranges.

The controllers have a maximum switching frequency of 100 kHz and always maintain control of the peak-primary current in the transformer. Protection features help keep primary and secondary component stresses in check. The UCC28710 allow the cable compensation to be programmed. The UCC28711, UCC28712 and UCC28713 devices allow remote temperature sensing using a negative temperature coefficient (NTC) resistor while providing fixed cable-compensation levels.

6 Pin Configuration and Functions

Pin Functions

NAME	PIN		I/O	DESCRIPTION
	UCC28710	UCC28711 UCC28712 UCC28713		
CBC	3	—	I	Cable compensation is a programming pin for compensation of cable voltage drop. Cable compensation is programmed with a resistor to GND.
CS	5	5	I	Current sense input connects to a ground-referenced current-sense resistor in series with the power switch. The resulting voltage is used to monitor and control the peak primary current. A series resistor can be added to this pin to compensate the peak switch current levels as the AC-mains input varies.
DRV	6	6	O	Drive is an output used to drive the gate of an external high voltage MOSFET switching transistor.
GND	4	4	—	The ground pin is both the reference pin for the controller and the low-side return for the drive output. Special care should be taken to return all AC decoupling capacitors as close as possible to this pin and avoid any common trace length with analog signal return paths.
HV	7	7	I	The high-voltage pin connects directly to the rectified bulk voltage and provides charge to the VDD capacitor for start-up of the power supply.
NTC	—	3	I	NTC an interface to an external negative temperature coefficient resistor for remote temperature sensing. Pulling this pin low shuts down PWM action.
VDD	1	1	I	VDD is the bias supply input pin to the controller. A carefully-placed bypass capacitor to GND is required on this pin.
VS	2	2	I	Voltage sense is an input used to provide voltage and timing feedback to the controller. This pin is connected to a voltage divider between an auxiliary winding and GND. The value of the upper resistor of this divider is used to program the AC-mains run and stop thresholds and line compensation at the CS pin.

7 Specifications

7.1 Absolute Maximum Ratings

 See ⁽¹⁾.

		MIN	MAX	UNIT
V _{HV}	Start-up pin voltage, HV		700	V
V _{VDD}	Bias supply voltage, VDD		38	V
I _{DRV}	Continuous gate current sink		50	mA
I _{DRV}	Continuous gate current source		Self-limiting	mA
I _{VS}	Peak current, VS		-1.2	mA
V _{DRV}	Gate drive voltage at DRV	-0.5	Self-limiting	V
Voltage	VS	-0.75	7	V
	CS, CBC, NTC	-0.5	5	V
T _J	Operating junction temperature	-55	150	°C
	Lead temperature 0.6 mm from case for 10 s		260	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under [Recommended Operating Conditions](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltages are with respect to GND. Currents are positive into, negative out of the specified terminal. These ratings apply over the operating ambient temperature ranges unless otherwise noted.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDD	Bias supply operating voltage	9		35	V
C _{VDD}	VDD bypass capacitor	0.047		1	μF
R _{CBC}	Cable-compensation resistance	10			kΩ
I _{VS}	VS pin current	-1			mA
T _J	Operating junction temperature	-40		125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		UCC2871x	UNIT
		D (SOIC)	
		7 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	141.5	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	73.8	°C/W
R _{θJB}	Junction-to-board thermal resistance	89	°C/W
ψ _{JT}	Junction-to-top characterization parameter	23.5	°C/W
ψ _{JB}	Junction-to-board characterization parameter	88.2	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

over operating free-air temperature range, $V_{VDD} = 25\text{ V}$, HV = open, $R_{CBC(NTC)} = \text{open}$, $T_A = -40\text{ }^\circ\text{C}$ to $125\text{ }^\circ\text{C}$, $T_A = T_J$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT		
HIGH-VOLTAGE START UP							
I_{HV}	Start-up current out of VDD	$V_{HV} = 100\text{ V}$, $V_{VDD} = 0\text{ V}$, start state		100	250	500	μA
I_{HVLKG}	Leakage current at HV	$V_{HV} = 400\text{ V}$, run state			0.1	1	μA
BIAS SUPPLY INPUT							
I_{RUN}	Supply current, run	$I_{DRV} = 0$, run state			2	2.65	mA
I_{WAIT}	Supply current, wait	$I_{DRV} = 0$, wait state			95	120	μA
I_{START}	Supply current, start	$I_{DRV} = 0$, $V_{VDD} = 18\text{ V}$, start state, $I_{HV} = 0$			18	30	μA
I_{FAULT}	Supply current, fault	$I_{DRV} = 0$, fault state			95	125	μA
UNDERVOLTAGE LOCKOUT							
$V_{VDD(on)}$	VDD turnon threshold	V_{VDD} low to high		19	21	23	V
$V_{VDD(off)}$	VDD turnoff threshold	V_{VDD} high to low		7.7	8.1	8.5	V
VS INPUT							
V_{VSR}	Regulating level	Measured at no-load condition, $T_J = 25\text{ }^\circ\text{C}^{(1)}$		4.01	4.05	4.09	V
V_{VSNCL}	Negative clamp level	$I_{VS} = -300\text{ }\mu\text{A}$, volts below ground		190	250	325	mV
I_{VSB}	Input bias current	$V_{VS} = 4\text{ V}$		-0.25	0	0.25	μA
CS INPUT							
$V_{CST(max)}$	Maximum CS threshold voltage	$V_{VS} = 3.7\text{ V}$		738	780	810	mV
$V_{CST(min)}$	Minimum CS threshold voltage	$V_{VS} = 4.35\text{ V}$		175	195	215	mV
K_{AM}	AM control ratio	$V_{CST(max)} / V_{CST(min)}$		3.6	4	4.4	V/V
V_{CCR}	Constant current regulating level	CC regulation constant		318	330	343	mV
K_{LC}	Line compensation current ratio	$I_{VSL} = -300\text{ }\mu\text{A}$, $I_{VSL} / \text{current out of CS pin}$		24	25	28.6	A/A
T_{CSLEB}	Leading-edge blanking time	DRV output duration, $V_{CS} = 1\text{ V}$		180	235	280	ns
DRIVERS							
I_{DRS}	DRV source current	$V_{DRV} = 8\text{ V}$, $V_{VDD} = 9\text{ V}$		20	25		mA
R_{DRVLS}	DRV low-side drive resistance	$I_{DRV} = 10\text{ mA}$			6	12	Ω
V_{DRCL}	DRV clamp voltage	$V_{VDD} = 35\text{ V}$			14	16	V
R_{DRVSS}	DRV pulldown in start state			150	190	230	k Ω

(1) The regulating level at VS decreases with temperature by $0.8\text{ mV}/^\circ\text{C}$. This compensation is included to reduce the power supply output voltage variance over temperature.

Electrical Characteristics (continued)

over operating free-air temperature range, $V_{DD} = 25\text{ V}$, HV = open, $R_{CBC(NTC)} = \text{open}$, $T_A = -40\text{ }^\circ\text{C}$ to $125\text{ }^\circ\text{C}$, $T_A = T_J$ (unless otherwise noted)

8 Detailed Description

8.1 Overview

The UCC2871x family is a flyback power supply controller which provides accurate voltage and constant current regulation with primary-side feedback, eliminating the need for opto-coupler feedback circuits. The controller operates in discontinuous conduction mode with valley-switching to minimize switching losses. The modulation scheme is a combination of frequency and primary peak current modulation to provide high conversion efficiency across the load range. The control law provides a wide-dynamic operating range of output power which allows the power designer to achieve the <10-mW stand-by power requirement.

During low-power operating ranges the device has power management features to reduce the device operating current at operating frequencies below 33 kHz. The UCC2871x family includes features in the modulator to reduce the EMI peak energy of the fundamental switching frequency and harmonics. Accurate voltage and constant current regulation, fast dynamic response, and fault protection are achieved with primary-side control. A complete charger solution can be realized with a straightforward design process, low cost and low component count.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Detailed Pin Description

8.3.1.1 VDD (Device Bias Voltage Supply)

The VDD pin is connected to a bypass capacitor to ground and a start-up resistance to the input bulk capacitor (+) terminal. The VDD turnon UVLO threshold is 21 V and turnoff UVLO threshold is 8.1 V, with an available operating range up to 35 V. The USB charging specification requires the output current to operate in constant-current mode from 5 V to a minimum of 2 V; this is easily achieved with a nominal VDD of approximately 25 V. The additional VDD headroom up to 35 V allows for VDD to rise due to the leakage energy delivered to the VDD capacitor in high-load conditions. Also, the wide VDD range provides the advantage of selecting a relatively small VDD capacitor and high-value start-up resistance to minimize no-load stand-by power loss in the start-up resistor.

8.3.1.2 GND (Ground)

This is a single ground reference external to the device for the gate drive current and analog signal reference. Place the VDD bypass capacitor close to GND and VDD with short traces to minimize noise on the VS and CS signal pins.

8.3.1.3 VS (Voltage-Sense)

The VS pin is connected to a resistor divider from the auxiliary winding to ground. The output-voltage feedback information is sampled at the end of the transformer secondary current demagnetization time to provide an accurate representation of the output voltage. Timing information to achieve valley-switching and to control the duty cycle of the secondary transformer current is determined by the waveform on the VS pin. Avoid placing a filter capacitor on this input which would interfere with accurate sensing of this waveform.

The VS pin also senses the bulk capacitor voltage to provide for AC-input run and stop thresholds, and to compensate the current-sense threshold across the AC-input range. This information is sensed during the MOSFET on-time. For the AC-input run/stop function, the run threshold on VS is 220 μ A and the stop threshold is 80 μ A. The values for the auxiliary voltage divider upper-resistor R_{S1} and lower-resistor R_{S2} can be determined by the equations below.

$$R_{S1} = \frac{V_{IN(run)} \times \sqrt{2}}{N_{PA} \times I_{VSL(run)}}$$

where

- N_{PA} is the transformer primary-to-auxiliary turns ratio,
- $V_{IN(run)}$ is the AC RMS voltage to enable turnon of the controller (run),
- $I_{VSL(run)}$ is the run-threshold for the current pulled out of the VS pin during the MOSFET on-time. (see the [Electrical Characteristics](#) table)

(1)

$$R_{S2} = \frac{R_{S1} \times V_{VSR}}{N_{AS} \times (V_{OCV} + V_F) - V_{VSR}}$$

where

- V_{OCV} is the converter regulated output voltage,
- V_F is the output rectifier forward drop at near-zero current,
- N_{AS} is the transformer auxiliary to secondary turns ratio,
- R_{S1} is the VS divider high-side resistance,
- V_{VSR} is the CV regulating level at the VS input (see the [Electrical Characteristics](#) table).

(2)

Feature Description (continued)

8.3.1.4 DRV (Gate Drive)

The DRV pin is connected to the MOSFET gate pin, usually through a series resistor. The gate driver provides a gate-drive signal limited to 14 V. The turnon characteristic of the driver is a 25-mA current source which limits the turnon dv/dt of the MOSFET drain and reduces the leading-edge current spike, but still provides gate-drive current to overcome the Miller plateau. The gate-drive turnoff current is determined by the low-side driver $R_{DS(on)}$ and any external gate-drive resistance. The user can reduce the turnoff MOSFET drain dv/dt by adding external gate resistance.

8.3.1.5 CS (Current Sense)

The current-sense pin is connected through a series resistor (R_{LC}) to the current-sense resistor (R_{CS}). The current-sense threshold is 0.75 V for $I_{PP(max)}$ and 0.25 V for $I_{PP(min)}$. The series resistor R_{LC} provides the function of feed-forward line compensation to eliminate change in I_{PP} due to change in di/dt and the propagation delay of the internal comparator and MOSFET turnoff time. There is an internal leading-edge blanking time of 235 ns to eliminate sensitivity to the MOSFET turnon current spike. It should not be necessary to place a bypass capacitor on the CS pin. The value of R_{CS} is determined by the target output current in constant-current (CC) regulation. The values of R_{CS} and R_{LC} can be determined by the equations below. The term η_{XFMR} is intended to account for the energy stored in the transformer but not delivered to the secondary. This includes transformer resistance and core loss, bias power, and primary-to-secondary leakage ratio.

Example: With a transformer core and winding loss of 5%, primary-to-secondary leakage inductance of 3.5%, and bias power to output power ratio of 1.5%. The η_{XFMR} value is approximately: $1 - 0.05 - 0.035 - 0.015 = 0.9$.

$$R_{CS} = \frac{V_{CCR} \times N_{PS}}{2I_{OCC}} \times \sqrt{\eta_{XFMR}}$$

where

- V_{CCR} is a current regulation constant (see the [Electrical Characteristics](#) table),
- N_{PS} is the transformer primary-to-secondary turns ratio (a ratio of 13 to 15 is recommended for 5-V output),
- I_{OCC} is the target output current in constant-current regulation,
- η_{XFMR} is the transformer efficiency. (3)

$$R_{LC} = \frac{K_{LC} \times R_{S1} \times R_{CS} \times T_D \times N_{PA}}{L_P}$$

where

- R_{S1} is the VS pin high-side resistor value,
- R_{CS} is the current-sense resistor value,
- T_D is the current-sense delay including MOSFET turnoff delay, add ~50 ns to MOSFET delay,
- N_{PA} is the transformer primary-to-auxiliary turns ratio,
- L_P is the transformer primary inductance,
- K_{LC} is a current-scaling constant (see the [Electrical Characteristics](#) table). (4)

8.3.1.6 CBC (Cable Compensation), Pin 1 UCC28700

The cable compensation pin is connected to a resistor to ground to program the amount of output voltage compensation to offset cable resistance. The cable compensation block provides a 0-V to 3-V voltage level on the CBC pin corresponding to 0 to I_{OCC} output current. The resistance selected on the CBC pin programs a current mirror that is summed into the VS feedback divider therefore increasing the output voltage as I_{OUT} increases. There is an internal series resistance of 28 k Ω to the CBC pin which sets a maximum cable compensation of a 5-V output to 400 mV when CBC is shorted to ground. The CBC resistance value can be determined by the equation below.

$$R_{CBC} = \frac{V_{CBC(max)} \times 3 \text{ k}\Omega \times (V_{OCV} + V_F)}{V_{VSR} \times V_{OCBC}} - 28 \text{ k}\Omega$$

Feature Description (continued)

where

- V_O is the output voltage,
- V_F is the diode forward voltage,
- V_{OCBC} is the target cable compensation voltage at the output terminals,
- $V_{CBC(max)}$ is the maximum voltage at the cable compensation pin at the maximum converter output current (see the [Electrical Characteristics](#) table),
- V_{VSR} is the CV regulating level at the VS input (see the [Electrical Characteristics](#) table). (5)

8.3.1.7 NTC (NTC Thermistor Shut-down), Pin 1 UCC28701/2/3

These versions of the UCC28700 family utilize pin 1 for an external NTC thermistor to allow user-programmable external thermal shut-down. The shut-down threshold is 0.95 V with an internal 105- μ A current source which results in a 9.05-k Ω thermistor shut-down threshold. These controllers have either zero or fixed internal cable compensation.

8.3.2 Fault Protection

There is comprehensive fault protection. Protection functions include:

- Output overvoltage fault
- Input undervoltage fault
- Internal overtemperature fault
- Primary overcurrent fault
- CS pin fault
- VS pin fault

A UVLO reset and restart sequence applies for all fault protection events.

The output overvoltage function is determined by the voltage feedback on the VS pin. If the voltage sample on VS exceeds 115% of the nominal V_{OUT} , the device stops switching and the internal current consumption is I_{FAULT} which discharges the VDD capacitor to the UVLO turnoff threshold. After that, the device returns to the start state and a start-up sequence ensues.

The UCC2871x family always operates with cycle-by-cycle primary peak current control. The normal operating range of the CS pin is 0.78 V to 0.195 V. There is additional protection if the CS pin reaches 1.5 V. This results in a UVLO reset and restart sequence.

The line input run and stop thresholds are determined by current information at the VS pin during the MOSFET on-time. While the VS pin is clamped close to GND during the MOSFET on-time, the current through R_{S1} is monitored to determine a sample of the bulk capacitor voltage. A wide separation of run and stop thresholds allows clean start-up and shut-down of the power supply with the line voltage. The run current threshold is 225 μ A and the stop current threshold is 80 μ A.

The internal over-temperature protection threshold is 165°C. If the junction temperature reaches this threshold the device initiates a UVLO reset cycle. If the temperature is still high at the end of the UVLO cycle, the protection cycle repeats.

Protection is included in the event of component failures on the VS pin. If complete loss of feedback information on the VS pin occurs, the controller stops switching and restarts.

8.4 Device Functional Modes

8.4.1 Primary-Side Voltage Regulation

[Figure 13](#) illustrates a simplified flyback convertor with the main voltage regulation blocks of the device shown. The power train operation is the same as any DCM flyback circuit but accurate output voltage and current sensing is the key to primary-side control.

Device Functional Modes (continued)

Figure 13. Simplified Flyback Converter (With the Main Voltage Regulation Blocks)

In primary-side control, the output voltage is sensed on the auxiliary winding during the transfer of transformer energy to the secondary. As shown in Figure 14 it is clear there is a down slope representing a decreasing total rectifier V_F and resistance voltage drop ($I_S R_S$) as the secondary current decreases to zero. To achieve an accurate representation of the secondary output voltage on the auxiliary winding, the discriminator reliably blocks the leakage inductance reset and ringing, continuously samples the auxiliary voltage during the down slope after the ringing is diminished, and captures the error signal at the time the secondary winding reaches zero current. The internal reference on VS is 4.05 V. Temperature compensation on the VS reference voltage of $-0.8\text{-mV}/^\circ\text{C}$ offsets the change in the output rectifier forward voltage with temperature. The resistor divider is selected as outlined in the VS pin description.

Figure 14. Auxiliary Winding Voltage

The UCC2871x family includes a VS signal sampler that signals discrimination methods to ensure an accurate sample of the output voltage from the auxiliary winding. There are however some details of the auxiliary winding signal to ensure reliable operation, specifically the reset time of the leakage inductance and the duration of any subsequent leakage inductance ring. Refer to Figure 15 below for a detailed illustration of waveform criteria to ensure a reliable sample on the VS pin. The first detail to examine is the duration of the leakage inductance reset pedestal, t_{LK_RESET} in Figure 15. Because this can mimic the waveform of the secondary current decay, followed by a sharp downslope, it is important to keep the leakage reset time less than 600 ns for I_{PRI} minimum, and less

Device Functional Modes (continued)

than 2.2 μ s for I_{PRI} maximum. The second detail is the amplitude of ringing on the V_{AUX} waveform following t_{LK_RESET} . The peak-to-peak voltage at the VS pin should be less than approximately 100 mV_{p-p} at least 200 ns before the end of the demagnetization time, t_{DM} . If there is a concern with excessive ringing, it usually occurs during light or no-load conditions, when t_{DM} is at the minimum. The tolerable ripple on VS is scaled up to the auxiliary winding voltage by R_{S1} and R_{S2} , and is equal to $100\text{ mV} \times (R_{S1} + R_{S2}) / R_{S2}$.

Figure 15. Auxiliary Waveform Details

During voltage regulation, the controller operates in frequency modulation mode and amplitude modulation mode as illustrated in Figure 16 below. The internal operating frequency limits of the device are 100 kHz maximum and $f_{SW(min)}$. The transformer primary inductance and primary peak current chosen sets the maximum operating frequency of the converter. The output preload resistor and efficiency at low power determines the converter minimum operating frequency. There is no stability compensation required for the UCC2871x family.

Figure 16. Frequency and Amplitude Modulation Modes (During Voltage Regulation)

Device Functional Modes (continued)

8.4.2 Primary-Side Current Regulation

Timing information at the VS pin and current information at the CS pin allow accurate regulation of the secondary average current. The control law dictates that as power is increased in CV regulation and approaching CC regulation the primary-peak current is at $I_{PP(max)}$. Referring to Figure 17 below, the primary-peak current, turns ratio, secondary demagnetization time (t_{DM}), and switching period (t_{SW}) determine the secondary average output current. Ignoring leakage inductance effects, the average output current is given by Equation 6. When the average output current reaches the regulation reference in the current control block, the controller operates in frequency modulation mode to control the output current at any output voltage at or below the voltage regulation target as long as the auxiliary winding can keep VDD above the UVLO turnoff threshold.

UDG-12203

Figure 17. Transformer Currents

$$I_{OUT} = \frac{I_{PP}}{2} \times \frac{N_P}{N_S} \times \frac{t_{DM}}{t_{SW}} \quad (6)$$

UDG-12201

Figure 18. Typical Target Output V-I Characteristic

8.4.3 Valley Switching

The UCC2871x family utilizes valley switching to reduce switching losses in the MOSFET, to reduce induced-EMI, and to minimize the turnon current spike at the sense resistor. The controller operates in valley-switching in all load conditions unless the V_{DS} ringing has diminished.

Device Functional Modes (continued)

Referring to [Figure 19](#) below, the UCC2871x family operates in a valley-skipping mode in most load conditions to maintain an accurate voltage or current regulation point and still switch on the lowest available V_{DS} voltage.

Figure 19. Valley-Skipping Mode

8.4.4 Start-Up Operation

The internal high-voltage start-up switch connected to the bulk capacitor voltage (V_{BLK}) through the HV pin charges the VDD capacitor. During start up there is typically 300 μ A available to charge the VDD capacitor. When VDD reaches the 21-V UVLO turnon threshold, the controller is enabled, the converter starts switching and the start-up switch is turned off. The initial three cycles are limited to $I_{PP(min)}$. After the initial three cycles at minimum $I_{PP(min)}$, the controller responds to the condition dictated by the control law. The converter will remain in discontinuous mode during charging of the output capacitor(s), maintaining a constant output current until the output voltage is in regulation.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The UCC2871x family of flyback power supply controllers provides constant voltage (CV) and constant current (CC) output regulation to help meet USB-compliant adaptors and charger requirements. These devices use the information obtained from auxiliary winding sensing (VS) to control the output voltage and do not require optocoupler/TL431 feedback circuitry. Eliminating the optocoupler feedback reduces component count and makes the design more cost effective. Refer to [Figure 20](#) for details.

9.2 Typical Application

The procedure in the [Detailed Design Procedure](#) section outlines the steps to design a constant-voltage, constant-current flyback converter using the UCC2871x family of controllers. Refer to the typical application schematic for component location ([Figure 20](#)) and the [Device Nomenclature](#) section for variable definitions.

Figure 20. Design Procedure Application Example

9.2.1 Design Requirements

Table 1. Design Parameters

PARAMETER	NOTES AND CONDITIONS	MIN	NOM	MAX	UNIT		
INPUT CHARACTERISTICS							
V_{IN}	Input Voltage	100	115/230	240	V		
f_{LINE}	Line Frequency	47	50/60	64	Hz

9.2.2 Detailed Design Procedure

9.2.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the UCC28710 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

9.2.2.2 Stand-by Power Estimate

Assuming no-load stand-by power is a critical design parameter, determine estimated no-load power based on target converter maximum switching frequency and output power rating.

The following equation estimates the stand-by power of the converter.

$$P_{SB_CONV} = \frac{P_{OUT} \times f_{MIN}}{\eta_{SB} \times K_{AM}^2 \times f_{MAX}} \quad (7)$$

For a typical USB charger application, the bias power during no-load is approximately 2.5 mW. This is based on 25-V V_{DD} and 100-μA bias current. The output preload resistor can be estimated by V_{OCV} and the difference in the converter stand-by power and the bias power. The equation for output preload resistance accounts for bias power estimated at 2.5 mW.

$$R_{PL} = \frac{V_{OCV}^2}{P_{SB_CONV} - 2.5 \text{ mW}} \quad (8)$$

The capacitor bulk voltage for the loss estimation is the highest voltage for the stand-by power measurement, typically 325 V_{DC}.

For the total stand-by power estimation add an estimated 2.5 mW for snubber loss to the converter stand-by power loss.

$$P_{SB} = P_{SB_CONV} + 2.5 \text{ mW} \quad (9)$$

9.2.2.3 Input Bulk Capacitance and Minimum Bulk Voltage

Determine the minimum voltage on the input capacitance, C_{B1} and C_{B2} total, in order to determine the maximum N_p to N_s turns ratio of the transformer. The input power of the converter based on target full-load efficiency, minimum input RMS voltage, and minimum AC input frequency are used to determine the input capacitance requirement.

Maximum input power is determined based on V_{OCV} , I_{OCC} , and the full-load efficiency target.

$$P_{IN} = \frac{V_{OCV} \times I_{OCC}}{\eta} \quad (10)$$

The below equation provides an accurate solution for input capacitance based on a target minimum bulk capacitor voltage. To target a given input capacitance value, iterate the minimum capacitor voltage to achieve the target capacitance.

$$C_{BULK} = \frac{2P_{IN} \times \left(0.25 + \frac{1}{2\pi} \times \arcsin \left(\frac{V_{BULK(min)}}{\sqrt{2} \times V_{IN(min)}} \right) \right)}{\left(2V_{IN(min)}^2 - V_{BULK(min)}^2 \right) \times f_{LINE}} \quad (11)$$

9.2.2.4 Transformer Turns Ratio, Inductance, Primary-Peak Current

The maximum primary-to-secondary turns ratio can be determined by the target maximum switching frequency at full load, the minimum input capacitor bulk voltage, and the estimated DCM resonant time.

Initially determine the maximum available total duty cycle of the on time and secondary conduction time based on target switching frequency and DCM resonant time. For DCM resonant time, assume 500 kHz if you do not have an estimate from previous designs. For the transition mode operation limit, the period required from the end of secondary current conduction to the first valley of the V_{DS} voltage is $\frac{1}{2}$ of the DCM resonant period, or 1 μ s assuming 500-kHz resonant frequency. D_{MAX} can be determined using the equation below.

$$D_{MAX} = 1 - \left(\frac{t_R}{2} \times f_{MAX} \right) - D_{MAGCC} \quad (12)$$

Once D_{MAX} is known, the maximum turns ratio of the primary to secondary can be determined with the equation below. D_{MAGCC} is defined as the secondary diode conduction duty cycle during constant-current, CC, operation. It is set internally by the UCC2871x family at 0.425. The total voltage on the secondary winding needs to be determined; which is the sum of V_{OCV} , the secondary rectifier V_F , and the cable compensation voltage (V_{OCBC}). For the 5-V USB charger applications, a turns ratio range of 13 to 15 is typically used.

$$N_{PS(max)} = \frac{D_{MAX} \times V_{BULK(min)}}{D_{MAGCC} \times (V_{OCV} + V_F + V_{OCBC})} \quad (13)$$

Once an optimum turns ratio is determined from a detailed transformer design, use this ratio for the following parameters.

The UCC2871x family constant-current regulation is achieved by maintaining a maximum D_{MAG} duty cycle of 0.425 at the maximum primary current setting. The transformer turns ratio and constant-current regulating voltage determine the current sense resistor for a target constant current.

Since not all of the energy stored in the transformer is transferred to the secondary, a transformer efficiency term is included. This efficiency number includes the core and winding losses, leakage inductance ratio, and bias power ratio to rated output power. For a 5-V, 1-A charger example, bias power of 1.5% is a good estimate. An overall transformer efficiency of 0.9 is a good estimate to include 3.5% leakage inductance, 5% core and winding loss, and 1.5% bias power.

$$R_{CS} = \frac{V_{CCR} \times N_{PS}}{2I_{OCC}} \times \sqrt{\eta_{XFMR}} \quad (14)$$

The primary transformer inductance can be calculated using the standard energy storage equation for flyback transformers. Primary current, maximum switching frequency and output and transformer power losses are included in the equation below. Initially determine transformer primary current.

Primary current is simply the maximum current sense threshold divided by the current sense resistance.

$$I_{PP(max)} = \frac{V_{CST(max)}}{R_{CS}} \quad (15)$$

$$L_P = \frac{2(V_{OCV} + V_F + V_{OCBC}) \times I_{OCC}}{\eta_{XFMR} \times I_{PP(max)}^2 \times f_{MAX}} \quad (16)$$

The secondary winding to auxiliary winding transformer turns ratio (N_{AS}) is determined by the lowest target operating output voltage in constant-current regulation and the VDD UVLO of the UCC2871x family. There is additional energy supplied to VDD from the transformer leakage inductance energy which allows a lower turns ratio to be used in many designs.

$$N_{AS} = \frac{V_{DD(off)} + V_{FA}}{V_{OCC} + V_F} \quad (17)$$

9.2.2.5 Transformer Parameter Verification

The transformer turns ratio selected affects the MOSFET V_{DS} and secondary rectifier reverse voltage so these should be reviewed. The UCC2871x family does require a minimum on time of the MOSFET (t_{ON}) and minimum D_{MAG} time (t_{DMAG}) of the secondary rectifier in the high line, minimum load condition. The selection of f_{MAX} , L_P and R_{CS} affects the minimum t_{ON} and t_{DMAG} .

The secondary rectifier and MOSFET voltage stress can be determined by the equations below.

$$V_{REV} = \frac{V_{IN(max)} \times \sqrt{2}}{N_{PS}} + V_{OCV} + V_{OCBC} \quad (18)$$

For the MOSFET V_{DS} voltage stress, an estimated leakage inductance voltage spike (V_{LK}) needs to be included.

$$V_{DSPK} = (V_{IN(max)} \times \sqrt{2}) + (V_{OCV} + V_F + V_{OCBC}) \times N_{PS} + V_{LK} \quad (19)$$

Equation 20 and Equation 21 are used to determine if the minimum t_{ON} target of 300 ns and minimum t_{DMAG} target of 1.2 μ s is achieved.

$$t_{ON(min)} = \frac{L_P}{V_{IN(max)} \times \sqrt{2}} \times \frac{I_{PP(max)} \times V_{CST(min)}}{V_{CST(max)}} \quad (20)$$

$$t_{DMAG(min)} = \frac{t_{ON} \times V_{IN(max)} \times \sqrt{2}}{N_{PS} \times (V_{OCV} + V_F)} \quad (21)$$

9.2.2.6 Output Capacitance

The output capacitance value is typically determined by the transient response requirement from no-load. For example, in some USB charger applications there is a requirement to maintain a minimum V_O of 4.1 V with a load-step transient of 0 mA to 500 mA. The equation below assumes that the switching frequency can be at the UCC2871x family's minimum of $f_{SW(min)}$.

$$C_{OUT} = \frac{I_{TRAN} \left(\frac{1}{f_{SW(min)}} + 150 \mu\text{s} \right)}{V_{O\Delta}} \quad (22)$$

Another consideration of the output capacitor(s) is the ripple voltage requirement which is reviewed based on secondary peak current and ESR. A margin of 20% is added to the capacitor ESR requirement in the equation below.

$$R_{ESR} = \frac{V_{RIPPLE} \times 0.8}{I_{PP(max)} \times N_{PS}} \quad (23)$$

9.2.2.7 VDD Capacitance, C_{DD}

The capacitance on VDD needs to supply the device operating current until the output of the converter reaches the target minimum operating voltage in constant-current regulation. At this time the auxiliary winding can sustain the voltage to the UCC2871x family. The total output current available to the load and to charge the output capacitors is the constant-current regulation target. The equation below assumes the output current of the flyback is available to charge the output capacitance until the minimum output voltage is achieved. There is an estimated 1 mA of gate-drive current in the equation and 1 V of margin added to VDD.

$$C_{DD} = \frac{(I_{RUN} + 1 \text{ mA}) \times \frac{C_{OUT} \times V_{OCC}}{I_{OCC}}}{(V_{DD(on)} - V_{DD(off)}) - 1 \text{ V}} \quad (24)$$

9.2.2.8 VS Resistor Divider, Line Compensation, and Cable Compensation

The VS divider resistors determine the output voltage regulation point of the flyback converter, also the high-side divider resistor (R_{S1}) determines the line voltage at which the controller enables continuous DRV operation. R_{S1} is initially determined based on transformer auxiliary to primary turns ratio and desired input voltage operating threshold.

$$R_{S1} = \frac{V_{IN(run)} \times \sqrt{2}}{N_{PA} \times I_{VSL(run)}} \quad (25)$$

The low-side VS pin resistor is selected based on desired V_O regulation voltage.

$$R_{S2} = \frac{R_{S1} \times V_{VSR}}{N_{AS} \times (V_{OCV} + V_F) - V_{VSR}} \quad (26)$$

The UCC2871x family can maintain tight constant-current regulation over input line by utilizing the line compensation feature. The line compensation resistor (R_{LC}) value is determined by current flowing in R_{S1} and expected gate drive and MOSFET turnoff delay. Assume a 50-ns internal delay in the UCC2871x family.

$$R_{LC} = \frac{K_{LC} \times R_{S1} \times R_{CS} \times t_D \times N_{PA}}{L_P} \quad (27)$$

On the UCC28710, which has adjustable cable compensation, the resistance for the desired compensation level at the output terminals can be determined using Equation 28.

$$R_{CBC} = \frac{V_{CBC(max)} \times 3 \text{ k}\Omega \times (V_{OCV} + V_F)}{V_{VSR} \times V_{OCBC}} - 28 \text{ k}\Omega \quad (28)$$

10 Power Supply Recommendations

The UCC2871x family is intended for AC/DC adapters and chargers with input voltage range of 85 V_{AC(rms)} to 265 V_{AC(rms)} using Flyback topology. It can be used in other applications and converter topologies with different input voltages. Be sure that all voltages and currents are within the recommended operating conditions and absolute maximum ratings of the device. To maintain output current regulation over the entire input voltage range, design the converter to operate close to f_{MAX} when in full-load conditions. To improve thermal performance increase the copper area connected to GND pins.

11 Layout

11.1 Layout Guidelines

- High frequency bypass Capacitor C5 should be placed across Pin 1 and 4 as close as you can get it to the pins.
- Resistor R4 and C5 form a low pass filter and the connection of R4 and C5 should be as close to the VDD pin as possible.
- The VS pin controls the output voltage through the transformer turns ratio and the voltage divider of R5 and R11. Note the trace length between the R5, R11 and VS pin should be as short as possible to reduce or eliminate possible EMI coupling.
- Note the IC ground and power ground should meet at the bulk capacitor's (C6 and C7) return. Try to ensure that high frequency/high current from the power stage does not go through the signal ground.
 - The high frequency/high current path that you need to be cautious of on the primary is C7 +, T1 (P5, P3), Q1d, Q1s, R8 to the return of C6 and C7. Try to keep all high current loops as short as possible.
- Try to keep all high current loops as short as possible.
- Keep all high current/high frequency traces away from or perpendicular to other traces in the design.
- Traces on the voltage clamp formed by D1, R2, D3 and C2 as short as possible.
- C6 return needs to be as close to the bulk capacitor supply as possible. This reduces the magnitude of dv/dt caused by large di/dt.
- Avoid mounting semiconductors under magnetics.

12.1.2 Device Nomenclature

12.1.2.1 Capacitance Terms in Farads

- C_{BULK} : total input capacitance of C_{B1} and C_{B2} .
- C_{DD} : minimum required capacitance on the VDD pin.
- C_{OUT} : minimum output capacitance required.

12.1.2.2 Duty Cycle Terms

- D_{MAGCC} : secondary diode conduction duty cycle in CC, 0.425.
- D_{MAX} : MOSFET on-time duty cycle.

12.1.2.3 Frequency Terms in Hertz

- f_{LINE} : minimum line frequency.
- f_{MAX} : target full-load maximum switching frequency of the converter.
- f_{MIN} : minimum switching frequency of the converter, add 15% margin over the $f_{SW(min)}$ limit of the device.
- $f_{SW(min)}$: minimum switching frequency (see [Electrical Characteristics](#)).

12.1.2.4 Current Terms in Amperes

- I_{OCC} : converter output constant-current target.
- $I_{PP(max)}$: maximum transformer primary current.
- I_{START} : start-up bias supply current (see [Electrical Characteristics](#)).
- I_{TRAN} : required positive load-step current.
- $I_{VSL(run)}$: VS pin run current (see [Electrical Characteristics](#)).

12.1.2.5 Current and Voltage Scaling Terms

- K_{AM} : maximum-to-minimum peak primary current ratio (see [Electrical Characteristics](#)).
- K_{LC} : current-scaling constant (see [Electrical Characteristics](#)).

Device Support (continued)

12.1.2.6 Transformer Terms

- L_P : transformer primary inductance.
- N_{AS} : transformer auxiliary-to-secondary turns ratio.
- N_{PA} : transformer primary-to-auxiliary turns ratio.
- N_{PS} : transformer primary-to-secondary turns ratio.

12.1.2.7 Power Terms in Watts

- P_{IN} : converter maximum input power.
- P_{OUT} : full-load output power of the converter.
- P_{RSTR} : VDD start-up resistor power dissipation.
- P_{SB} : total stand-by power.
- P_{SB_CONV} : P_{SB} minus start-up resistor and snubber losses.

12.1.2.8 Resistance Terms in Ω

- R_{CS} : primary current programming resistance.
- R_{ESR} : total ESR of the output capacitor(s).
- R_{PL} : preload resistance on the output of the converter.
- R_{S1} : high-side VS pin resistance.
- R_{S2} : low-side VS pin resistance.

12.1.2.9 Timing Terms in Seconds

- t_D : current-sense delay including MOSFET turn-off delay; add 50 ns to MOSFET delay.
- $t_{DMAG(min)}$: minimum secondary rectifier conduction time.
- $t_{ON(min)}$: minimum MOSFET on time.
- t_R : resonant frequency during the DCM (discontinuous conduction mode) time.

12.1.2.10 Voltage Terms in Volts

- V_{BLK} : highest bulk capacitor voltage for stand-by power measurement.
- $V_{BULK(min)}$: minimum voltage on C_{B1} and C_{B2} at full power.
- V_{OCBC} : target cable compensation voltage at the output terminals.
- $V_{CBC(max)}$: maximum voltage at the CBC pin at the maximum converter output current (see [Electrical Characteristics](#)).
- V_{CCR} : constant-current regulating voltage (see [Electrical Characteristics](#)).
- $V_{CST(max)}$: CS pin maximum current-sense threshold (see [Electrical Characteristics](#)).
- $V_{CST(min)}$: CS pin minimum current-sense threshold (see [Electrical Characteristics](#)).
- $V_{DD(off)}$: UVLO turn-off voltage (see [Electrical Characteristics](#)).
- $V_{DD(on)}$: UVLO turn-on voltage (see [Electrical Characteristics](#)).
- $V_{O\Delta}$: output voltage drop allowed during the load-step transient.
- V_{DSPK} : peak MOSFET drain-to-source voltage at high line.
- V_F : secondary rectifier forward voltage drop at near-zero current.
- V_{FA} : auxiliary rectifier forward voltage drop.
- V_{LK} : estimated leakage inductance energy reset voltage.
- V_{OCV} : regulated output voltage of the converter.
- V_{OCC} : target lowest converter output voltage in constant-current regulation.
- V_{REV} : peak reverse voltage on the secondary rectifier.
- V_{RIPPLE} : output peak-to-peak ripple voltage at full-load.
- V_{VSR} : CV regulating level at the VS input (see [Electrical Characteristics](#)).

12.1.2.11 AC Voltage Terms in V_{RMS}

- $V_{IN(max)}$: maximum input voltage to the converter.

Device Support (continued)

- $V_{IN(min)}$: minimum input voltage to the converter.
- $V_{IN(run)}$: converter input start-up (run) voltage.

12.1.2.12 Efficiency Terms

- η_{SB} : estimated efficiency of the converter at no-load condition, not including start-up resistance or bias losses. For a 5-V USB charger application, 60% to 65% is a good initial estimate.
- η : converter overall efficiency.
- η_{XFMR} : transformer primary-to-secondary power transfer efficiency.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
UCC28710D	ACTIVE	SOIC	D	7	75	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	U28710	Samples
UCC28710DR	ACTIVE	SOIC	D	7	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	U28710	Samples
UCC28711D	ACTIVE	SOIC	D	7	75	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	U28711	Samples
UCC28711DR	ACTIVE	SOIC	D	7	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	U28711	Samples
UCC28712D	ACTIVE	SOIC	D	7	75	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	U28712	Samples
UCC28712DR	ACTIVE	SOIC	D	7	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	U28712	Samples
UCC28713D	ACTIVE	SOIC	D	7	75	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	U28713	Samples
UCC28713DR	ACTIVE	SOIC	D	7	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	U28713	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

D0007A

PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

EXAMPLE BOARD LAYOUT

D0007A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:8X

SOLDER MASK DETAILS

4220728/A 01/2018

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

D0007A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

4220728/A 01/2018

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
